PRELIMINARY ASSESSMENT REPORT

CIRCLE COURT GROUND WATER WILLOW PARK, PARKER COUNTY, TEXAS TXN000606965

Prepared in cooperation with the

Texas Commission on Environmental Quality and U.S. Environmental Protection Agency

Prepared by

Texas Commission on Environmental Quality Austin, Texas

March 2009

The preparation of this report was financed through grants from the U.S. Environmental Protection Agency and administered through the Texas Commission on Environmental Quality.

NOTE

The State predecessor agencies: Texas Water Quality Board (TWQB), Texas Department of Water Resources (TDWR), Texas Water Commission (TWC), Texas Air Control Board (TACB) and Texas Natural Resources Conservation Commission (TNRCC) referred to throughout this report are now known as the Texas Commission on Environmental Quality. The new agency, TCEQ, became effective September 1, 2002, as mandated under State House Bill No. 2912 of the 77th Regular Legislative Session.

INTRODUCTION

The Texas Commission on Environmental Quality (TCEQ) was tasked by the U.S. Environmental Protection Agency (EPA) Region VI to conduct a Preliminary Assessment (PA) of the Circle Court Ground Water (the Site) located in Parker County, Texas. The PA is an initial screening of the Site's conditions to determine compliance with standards and regulations pursuant to the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA) as amended, 42 U.S.C. 9601, et seq. (Ref. 1, 2 and 3). For this purpose, the Site is a geographical area located within a rural area south of Interstate 20 in eastern Parker County, Texas. The source for the release to groundwater is currently unknown.

The specific goals for the Circle Court Ground Water investigation are:

- Determine the potential threat to public health or the environment posed by the Site;
- Determine the potential for a release of hazardous constituents into the environment; and
- Determine the potential for placement of the Site on the National Priorities List (NPL).

Completion of the PA included reviewing existing Site information, collecting receptor information within the range of Site influence, and determining regional geology, groundwater, surface water and surrounding population. This document includes a discussion of Site background information (Section 2), a discussion of migration/exposure pathways and potential receptors (targets; Section 3) and a list of pertinent references (Section 4).

2 SITE BACKGROUND

2.1 SITE LOCATION

Site Name:

Circle Court Ground Water

CERCLIS ID No.:

TXN000606965

Location:

Parker County, Texas

Latitude:

32.745N

Longitude:

-97.678333W

Legal Description:

Lots 1 and 2, Block 3, Hillcrest Subdivision

Congressional District:

U.S. Congressional District 12

Site Owner:

City of Willow Park

516 Ranch House Road Willow Park, TX 76087

(817) 441-7108

Site Contact:

Lance Petty

Director of Public Works

3500 Indian Camp

Willow Park, TX 76087

(817) 441-5027

2.2 SITE DESCRIPTION

The Circle Court Ground Water site (the "Site") is located at 117 Circle Court, 100 yards north-northwest of the intersection of Circle Drive and Circle Court in Willow Park, Parker County, Texas. It lies 0.28 miles south of Interstate 20 and 0.3 mile west of FM 5 (Annetta Road) and is 6 miles east of the City of Weatherford (Fig. 2-1). In this rural residential area, single-family residences immediately surround the Site on the south, west and east sides. A 15-acre vacant wooded lot borders the Site on the north. North of the wooded lot, approximately 0.15 miles north of the Site, is a truck stop/diner. Lake Weatherford is approximately 1.75 miles north of the Site.

The main building of the Parker County Airport is 0.32 miles northwest of the Site at 3816 E. Interstate 20 in the City of Hudson Oaks, and the nearest point of the north/south-oriented airport runway is 0.22 miles west of the Site. A lawnmower repair shop is located 0.28 miles northwest of the Site, and a strip shopping center, which includes a dry cleaner facility and a gas station, is located 0.21 miles east-northeast of the Site (Figure 2-2).

The Site is designated as contaminated ground water originating from an unknown source. A volatile organic compound (VOC), trichloroethene (TCE), was first detected in concentrations above the EPA maximum contaminant limit (MCL) for drinking water of 5 micrograms per liter (μ g/L) in a routine ground water sampling event conducted on March 23, 2006. Trichloroethene is a colorless or blue organic liquid with a chloroform-like odor. The greatest use of trichloroethene is to remove grease from fabricated metal parts and some textiles (Ref. 4, p. 1).

2.3 OWNERSHIP HISTORY

State Well No. 32-19-201 is the indicator and nearest well to the contaminated ground water. The well is part of the Willow Park Municipal System, which is owned and operated by the City of Willow Park. Originally, Willow Park operated a portion of the old Chico water system and a separate water system just to the east of Lake Weatherford. Over time, the incorporation of several other private well systems and city wells were included to form a large system capable of supplying new subdivisions. An upgrade involved the connection of the main system, which is east of the Clear Fork, with the Willow Springs Oaks area, west of the Clear Fork (Ref. 5, p. 10-1).

Willow Park Municipal System is registered in the Public Water Supply (PWS) Program, Identification No. 1840027. The indicator well is located at latitude 32.745N and longitude -97.678333W at the Willow Springs Oaks Pump Station, 117 Circle Court, Willow Park, Texas. The indicator well is identified by Willow Park Municipal System as Well No. 20 (TCEQ Source Code G1840027U). Texas Water Development Board Water Well data indicate that the well was drilled on 07/15/1965 to a depth of 180 feet (Ref. 6, p. 55). The indicator well is one of three active wells in the Willow Park Municipal System that were formerly registered in the PWS Program to the City of Willow Park under the Willow Springs Oaks Water System, PWS Identification No. 1840093. The two water systems were merged in 2001 (Ref. 7, p. 2). The three wells that were

formerly part of the Willow Springs Oaks Water System now provide drinking water to 114 residential connections in Pressure Plane No. 2 of the Willow Park Municipal System (Ref. 8, p. 3).

2.4 OPERATIONS AND WASTE CHARACTERISTICS

The Willow Park Municipal System currently provides drinking water to approximately 5,897 persons through 1,685 connections (Ref. 9, p. 1). Ground water is pumped from 17 operational wells through 5 pump stations to 11 points of entry (POE) in the system: Indian Camp Pump Station (POE001), located at 3500 Indian Camp; Willow Wood Pump Station (POE002), located at 3323 Forest Circle; Fox Hunt Pump Station (POE009), located at 1109 Fox Hunt Trail; Willow Springs Pump Station (POE010), located at 4820 Misty Meadow; and Willow Springs Oaks Pump Station (POE011), located at 117 Circle Court. The indicator well, Well 20, is the only well providing drinking water to the distribution system through POE011. TCE was detected at a concentration above the MCL in a routine sample collected at POE011 on March 23, 2006, and granular activated carbon (GAC) filters were installed on the well on June 19, 2006. The well was subsequently put back into service. Presently, ground water pumped from Well 20 at the Willow Spring Oaks Pump Station passes through the filters before being disinfected by hypochlorination and sent to the above-ground water storage tank for distribution (Ref. 8, pp. 2-4).

Chemical use is limited to disinfection of the raw ground water by gaseous chlorination at the Indian Camp Pump Station and by sodium hypochlorite at all other pump stations. Monitoring and recording of chlorine residual at each POE is performed by water system personnel on a daily basis (Ref. 9, p. 5).

The TCEQ Drinking Water Quality Team has set sampling requirements and sample collection schedules for each POE in the Willow Park Municipal System in addition to periodic monitoring in the distribution system. At POE011 (Sample Site 11), the following tests and sample periods are required:

- a. Cyanide; 6-year
- b. Minerals; triennial
- c. Metals; 6-year
- d. Nitrate; annual
- e. Radionuclides; triennial

- f. Synthetic organic compounds; triennial
- g. Volatile organic compounds; annual

Samples are tested for volatile organic compounds on an annual basis at POE011 due to the past detections (Ref. 10, pp 1-3).

2.5 PREVIOUS INVESTIGATIONS

Routine Comprehensive Compliance Investigations (CCI) were conducted by TCEQ PWS personnel in 1999, 2001, 2002 and 2007. A Notice of Violation was issued on January 3, 2008 for alleged record-keeping and facility maintenance violations noted during the most recent CCI conducted on October 24, 2007. Compliance documentation was subsequently submitted to the TCEQ Region 4 office, and a Notice of Compliance was issued on September 25, 2008.

Pursuant to a request from the TCEQ, Eagle Construction and Environmental Services, L.P. (Eagle) mobilized to the City of Willow Park on June 1, 2006 to initiate sampling of select private water wells in the vicinity of Willow Park Municipal System Well 20 (State Well ID No. 32-19-201). The June 1-2, 2006 sampling event was conducted as a result of TCE detection of 33.91 μg/L, above the MCL of 5.0 μg/L, in a sample collected from POE011 on May 4, 2006 as a follow-up to the March 23, 2006 routine sample. Because of the potential emergency situation of multiple private well owners drinking contaminated groundwater, the TCEQ Field Operations Division authorized Eagle to collect and have analyzed water samples from nine (9) private water wells in the vicinity (Figure 2-3). The samples were analyzed for concentrations of VOCs by a drinking water certified laboratory utilizing drinking water methods. A review of the laboratory analytical results indicated that concentrations of TCE (above laboratory detection limits) were detected in five (5) of the samples collected from the private water wells.

2.5.1 Sample Results

Available water sample analyses data from the TCEQ Drinking Water Quality Team, Public Drinking Water Section indicate that TCE was first detected in a routine sample collected from POE010 on 10/29/2001 at a concentration of 2.4 μg/L, below the MCL of 5.0 μg/L (Table 2-1) (Ref. 11, pp 1-10). TCE was next detected in a routine sample collected from POE011 on 03/19/2002 at a concentration of 1.9 μg/L. POE010 and POE011 are interconnected by a valve located at the corner of Bankhead Road and Kingswood Road. The valve is open under normal operating procedures

(Ref. 9, p. 11). The locations of POE010, POE011 and the interconnection valve are shown in Figure 2-3. Six subsequent samplings conducted periodically at POE011 from 09/18/2002 to 03/15/2005 revealed TCE detections ranging from 1.3 μ g/L to 3.4 μ g/L, all below the MCL of 5 μ g/L. On 03/23/2006 the routine sample at POE011 revealed a TCE concentration of 6.03 μ g/L. As a result, Willow Park Municipal System voluntarily took Well 20 out of service on 4/1/2006 (Ref. 12, p. 1). Follow-up confirmation sampling directly from Well 20 was conducted on 05/04/2006 and revealed a TCE concentration of 33.9 μ g/L (Ref. 13, pp. 1-5).

On 06/19/2006 the GAC filters were installed on Well 20 so that the pumped water first passes through the filters prior to disinfection by hypochlorination and being sent to the above-ground storage tank. Willow Park Municipal System personnel subsequently began voluntary periodic collection of samples for TCE concentrations before and after the GAC filters at POE011. The samples were analyzed for concentrations of VOCs by Talem, Inc., a drinking water certified laboratory, utilizing drinking water methods. The TCE concentrations after the filter at POE011 have been below the MCL. The results of the raw water and post-filter TCE concentrations from POE011 in samples collected by Willow Park Municipal System personnel are listed in Table 2.1. An anomaly exists in the sample results from the 12/05/2007 and may be due to a mislabeling of samples (Ref. 14).

Other hazardous substances have been detected in samples from POE011, as well as other POE in the Willow Park Municipal System. Table 2-2 lists historical sampling analyses results for VOCs in all POE of the Willow Park Municipal System.

Eagle mobilized to the Willow Park Municipal System on June 1, 2006 to initiate the water well sampling activities from nine (9) private wells in the vicinity of POE011. The wells sampled on June 1 and 2, along with the well owners' names and addresses, are summarized in Table 2-3. The locations of the sampled water wells are shown in Figure 2.4 (Ref. 15).

A review of the laboratory analytical results indicated that concentrations of trichloroethylene (above laboratory detection limits) were detected in several of the samples collected from the water wells, including Davis #1 (1.54 μ g/L), Murphy (2.59 μ g/L) Lasater #1 (4.67 μ g/L); Keller (2.45 μ g/L) and Barnett #2 (12.2 μ g/L). Low concentrations of methylene chloride were present in all of

the samples, including the field blanks, duplicates and trip blank, and this compound is considered to be an artifact of laboratory contamination and not a constituent of concern. In addition, 1, 4-dichlorobenzene and naphthalene were detected at very low concentrations in both field blanks but were not detected in any of the well samples. For this reason, these two compounds are not considered constituents of concern (Ref. 15). A summary of the laboratory analytical results for all of the private water well samples, including quality control samples, is included in Table 2-4.

2.5.2 Sources

The Willow Springs Oaks pump station is located in a rural residential area. No potential sources of hazardous substances have been located in the immediate vicinity of POE011. A review of the laboratory analytical results and comparison of these results with the EPA primary drinking water standards indicate that the MCL for TCE was exceeded in the sample collected from the Barnett #2 well located at Parker County Airport. Concentrations of TCE below the drinking water MCL were detected in several of the samples collected from wells in the area. The distribution of this compound suggests a source area to the north-northwest of the Willow Park Municipal System's PWS Well 20 (Ref. 15).

2-1 Raw Water and Post-Filter TCE Concentrations from POE 011 Samples Collected by Willow Park Municipal System Personnel (Ref. 14)

Collected date	Raw water TCE concentration (µg/L)	Above MCL or PCL	Post-filter TCE concentration (µg/L)	Above MCL or PCL

MIGRATION/EXPOSURE PATHWAYS

The following sections describe migration/exposure pathways and potential targets within the Site's range of influence (Figure 3-1).

3.1 GROUNDWATER MIGRATION PATHWAY

The target distance limit (TDL) for the groundwater migration pathway is a 4-mile radius that extends from the indicator well. Figure 3-1 depicts the groundwater 4-mile TDL.

3.1.1 Soils

3

According to the Soil Survey of Parker County, Texas (1977), the Site is located on the Brackett and Maloterre soils, 3 to 12 percent slopes, gently sloping to strongly sloping soils on upland ridges (Ref. 16). The average composition of the soils is 50 percent Brackett soil, 22 percent Maloterre soil and 28 percent soils of minor extent, but composition is variable. Brackett soils are along side slopes and usually have a slope of 5 to 12 percent (Ref. 16, p. 16). In a representative profile of a Brackett soil, the surface layer is calcareous clay loam approximately 4 inches thick. The next 10 inches is calcareous loam. The underlying material is weakly cemented limestone and calcareous clay loam (Ref. 16, p. 15). It is as much as 35 percent limestone gravel, cobbles and fossil fragments. Maloterre soils, where present, are along the more nearly level ridgetops and usually have a slope of 3 to 5 percent. The surface layer of grayish-brown gravelly clay loam is about 8 inches thick. The underlying material is indurated limestone that contains many fossil shells (Ref. 16, p. 16).

3.1.2 Geologic Setting

The Site is located in the Western Cross Timbers region of Texas, on the western margin of the Grand Prairie (Ref. 17). In this vicinity, the Grand Prairie is underlain by alternating limestones and marls of the Fredericksburg Group. The intervening marls form low escarpments that connect successive uplands and produce a "cuesta" topography. The surfaces of the terraces slope gently

eastward (Ref. 18, p. 4, 14). The Fredericksburg Group of the Comanche Series consists predominantly of limestone, shale, clay, and marl and yields only small amounts of water to localized areas (Ref. 18, p. 10). In Parker County, the Fredericksburg Group is comprised of the Goodland Formation and Walnut Clay (or Walnut) Formation (Ref. 19, pp. 2-19). The Site and indicator well are located on the Walnut Clay Formation (Fig. 2-5). The Walnut Clay consists of clay and limestone, about equally abundant, with a thickness of approximately 30 ft. (Ref. 20, p. 5). In the Site area, the Walnut Clay overlies the Trinity Group, a water-bearing formation of Cretaceous age (Ref. 19, pp. 2-15, 2-19).

3.1.3 Aquifer System

The Trinity Group is the principal water-bearing group of rocks in the region and is divided into the Paluxy, Glen Rose, Twin Mountains, and Antlers Formations (Ref. 18, p. 10). The indicator well is in the Paluxy Formation of the Trinity Group (Ref. 6, p. 55). The Paluxy Formation is the upper member of the Trinity Group south of the Glen Rose pinch-out and forms the surface of the Western Cross Timbers belt. The dip is easterly at an average rate of 30 feet per mile (5.7 m/km) near the outcrop, increasing to 80 feet per mile (15.2 m/km) near the downdip limit of fresh to slightly saline water (Ref. 18, p.14). The thickness of the Paluxy in the general area of the Site is approximately 95-105 feet (Ref. 20, p. 5).

The Paluxy is composed predominantly of fine- to coarse-grained, friable, homogeneous, white quartz sand interbedded with sandy, silty, calcareous, or waxy clay and shale. In general, coarse-grained sand is in the lower part. The Paluxy grades upward into fine-grained sand with variable amounts of shale and clay. The sands are usually well sorted, poorly cemented, and cross-bedded (Ref. 18, p.14). The Paluxy is capable of yielding small to moderate amounts of water (Ref. 18, p. 10).

The majority of the Paluxy outcrop occurs in Hood, Parker, Tarrant, and Wise Counties and occupies approximately 650 square miles. The primary source of recharge to the Paluxy is precipitation on the outcrop. Secondary sources include recharge from streams flowing across the outcrop and surface-water seepage from lakes. The average annual precipitation on the outcrop is approximately 31 inches. Only a small fraction of the amount is available as effective recharge since there is much runoff and evapotranspiration. Water in the outcrop area is under water-table conditions, and water levels remain fairly constant with only normal seasonal fluctuations. In

downdip areas, water is under artesian conditions and is confined under hydrostatic pressure from overlying formations. The average rate of movement of water in the Paluxy amounts to less than 2 feet per year in an easterly direction except in downdip areas of heavy pumpage, where cones of depression have occurred and movement is towards the center of the pumped wells. Water-level measurements indicate the hydraulic gradient is approximately 27 feet per mile (Ref. 18, p. 39).

3.1.4 Drinking Water Receptors

Based on the 2000 U.S. census, the North Central Texas Council of Governments (NCTCOG) estimates that approximately 11,309 persons per live within a 4-mile radius of the Site (Ref. 21, p. 1). However, the NCTCOG has also estimated that the population of Parker County has grown from 88,495 in 2000 to 120,300 in 2008, an increase of nearly 36% (Ref. 22, p. 3).

Well water uses within the 4-mile target distance limit (TDL) include public water supply, domestic, irrigation, commercial, stock or livestock and miscellaneous uses. A search of the TCEQ water well database revealed 61 public water supply wells within the 4-mile TDL (Ref. 23, pp. 1-4). The number of persons served by the public water supply wells is unknown. The Texas Department of Licensing and Regulation database identifies approximately 360 domestic wells within the 4-mile TDL (Ref. 24) (Fig. 3-3). Based on NCTCOG's estimate of 2.82 persons per household within a 4-mile radius of the Site, the total number of persons utilizing domestic wells is 1,016 (Ref. 21, p. 1).

No wetland acreage is located within a 4-mile radius of the Site. It is unknown whether the Site is within a TCEQ Source Water Protection Program area (formerly the Wellhead Protection Program).

3.2 SURFACE WATER MIGRATION PATHWAY

The Surface Water Exposure Pathway will not be evaluated since the Site has been identified as contaminated ground water with no identified source.

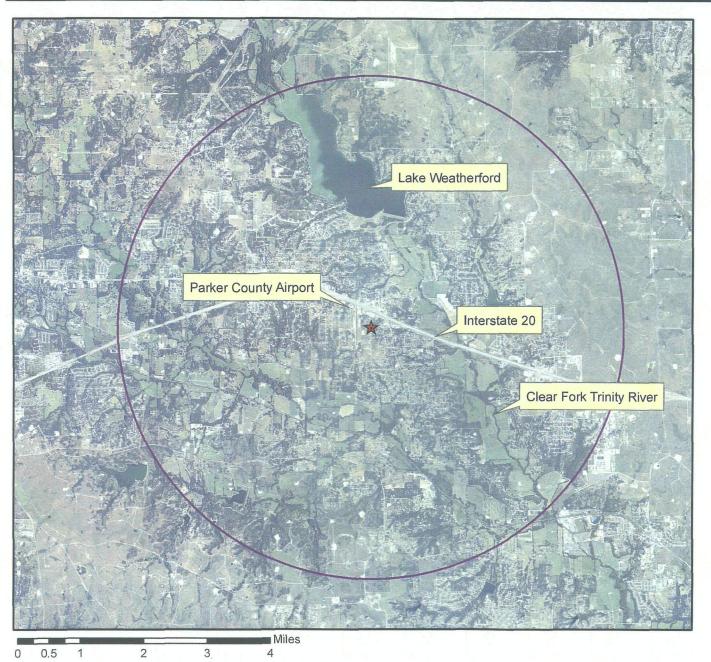

3.3 SOIL EXPOSURE PATHWAY

The Soil Exposure Pathway will not be evaluated since the Site has been identified as contaminated ground water with no identified source.

3.4 AIR EXPOSURE PATHWAY

The Air Exposure Pathway will not be evaluated since the Site has been identified as contaminated ground water with no identified source.

Consumer Factsheet on: TRICHLOROETHYLENE

List of Contaminants

As part of the Drinking Water and Health pages, this fact sheet is part of a larger publication:

National Primary Drinking Water Regulations

This is a factsheet about a chemical that may be found in some public or private drinking water supplies. It may cause health problems if found in amounts greater than the health standard set by the United States Environmental Protection Agency (EPA).

What is Trichloroethylene and how is it used?

Trichloroethylene is a colorless or blue organic liquid with a chloroform-like odor. The greatest use of trichloroethylene is to remove grease from fabricated metal parts and some textiles.

The list of trade names given below may help you find out whether you are using this chemical at home or work.

Trade Names and Synonyms:

1,1,2-Trichloroethylene
Acetylene trichloroethylene
Algylen
Anameth
Benzinol
Chlorilen
CirCosolv
Germalgene
Lethurin
Perm-a-chlor

Why is Trichloroethylene being Regulated?

In 1974, Congress passed the Safe Drinking Water Act. This law requires EPA to determine safe levels of chemicals in drinking water which do or may cause health problems. These non-enforceable levels, based solely on possible health risks and exposure, are called Maximum Contaminant Level Goals.

The MCLG for trichloroethylene has been set at zero because EPA believes this level of protection would not cause any of the potential health problems described below.

Based on this MCLG, EPA has set an enforceable standard called a Maximum Contaminant Level (MCL). MCLs are set as close to the MCLGs as possible, considering the ability of public water systems to detect and remove contaminants using suitable treatment technologies.

The MCL has been set at 5 parts per billion (ppb) because EPA believes, given present technology and resources, this is the lowest level to which water systems can reasonably be required to remove

Petzinol Philex TRI-Plus M Vitran this contaminant should it occur in drinking water.

These drinking water standards and the regulations for ensuring these standards are met, are called National Primary Drinking Water Regulations. All public water supplies must abide by these regulations.

What are the Health Effects?

Some people who drink water containing trichloroethylene in excess of the MCL over many years could experience problems with their liver and may have an increased risk of getting cancer.

How much Trichloroethylene is produced and released to the environment?

Production of trichloroethylene has increased from just over 260,000 lbs. in 1981 to 320 million lbs. in 1991. Major environmental releases of trichloroethylene are due to air emissions from metal degreasing plants. Wastewater from metal finishing, paint and ink formulation, electrical/electronic components, and rubber processing industries also may contain trichloroethylene.

From 1987 to 1993, according to the Toxics Release Inventory, trichloroethylene releases to water and land totalled over 291,000 lbs. These releases were primarily from steel pipe and tube manufacturing industries. The largest releases occurred in Pennsylvania and Illinois. The largest direct releases to water occurred in West Virginia.

What happens to Trichloroethylene when it is released to the environment?

Trichloroethylene released to soil will either evaporate or leach into ground water. If released to water, it will also quickly evaporate. It has only a moderate potential to accumulate in aquatic life.

How will Trichloroethylene be Detected in and Removed from My Drinking Water?

The regulation for trichloroethylene became effective in 1989. Between 1993 and 1995, EPA required your water supplier to collect water samples every 3 months for one year and analyze them to find out if TCE is present above 0.5 ppb. If it is present above this level, the system must continue to monitor this contaminant until the system has taken immediate steps to remediate the problem or the State has determined that the contaminant will remain reliably and consistently below the MCL.

If contaminant levels are found to be consistently above the MCL, your water supplier must take steps to reduce the amount of TCE so that it is consistently below that level. The following treatment methods have been approved by EPA for removing TCE: Granular activated carbon in combination with Packed Tower Aeration.

How will I know if Trichloroethylene is in my drinking water?

If the levels of trichloroethylene exceed the MCL, 5 ppb, the system must notify the public via newspapers, radio, TV and other means. Additional actions, such as providing alternative drinking water supplies, may be required to prevent serious risks to public health.

Drinking Water Standards:

Mclg: zero

Mcl: 5 ppb

Trichloroethylene Releases to Water and Land, 1987 to 1993 (in pounds):

TOTALS (in	pounds)	Water 100,293	Land 191,088
Top Six Sta	ites*		
PA	. 0	33,450

GA	3,742	17,532							
TX	0	21,000							
MA	0	19,920							
WV	12,822	0							
Major Indus	stries								
Steel pipe, to	ubes .	31 39,288							
Misc. Indust	. Organics	27,708	0						
Car parts, ad	ccess.	4,405	19,920						
Plating, polis	shing	3,342	20,100						
Wool fabric		3,942	18,081						

^{*} State totals only include facilities with releases greater than 10,000 lbs.

Learn more about your drinking water!

EPA strongly encourages people to learn more about their drinking water, and to support local efforts to protect and upgrade the supply of safe drinking water. Your water bill or telephone books government listings are a good starting point.

Your local water supplier can give you a list of the chemicals they test for in your water, as well as how your water is treated.

Your state Department of Health/Environment is also a valuable source of information.

For help in locating these agencies or for information on drinking water in general, call: EPAs Safe Drinking Water Hotline: (800) 426-4791.

For additional information on the uses and releases of chemicals in your state, contact the: Community Right-to-Know Hotline: (800) 424-9346.

SERVICE HISTORIES

RELEVANCE OF HISTORY

The issue of water in southeastern Parker County is becoming complex due to the number of entities which will potentially be involved. Therefore, it is hard to extrapolate each entity's future interests without a quick review of their pasts. This will provide a more complete framework for the decisions to be made and the social, political and physical constraints involved.

PARKER COUNTY

Parker County was established in 1855. It covers 902 square miles straddling the ridge separating the Trinity River and Brazos River basins. Located immediately west of Tarrant County (Fort Worth), it has enjoyed a long relationship as a bordering rural area to the growing Fort-Worth Dallas metroplex. Elevation for the county ranges from 700 to 1400 ft MSL and the general terrain is hilly. The county normally receives just over 32 inches of rain per year and experiences an average monthly temperature range of 34 to 96 degrees Fahrenheit. The county seat is Weatherford which has a population of approximately 20,000 people. The county is dotted with an estimated 20 other small towns and communities for a total county population of greater than 70,000 people.

Historically, the county has been considered agricultural, but is currently trending toward urbanized uses. Water for domestic uses has typically been supplied by wells drilled to Paluxy or lower Trinity formations. The Brazos River flows along the southwestern side of the county. The Clear Fork of the Trinity River flows through the eastern portion of the county. Lake Weatherford, owned and operated by the City of Weatherford, is on the Clear Fork. At present, sewer in the county is primarily via septic tanks.

WEATHERFORD

The City of Weatherford was founded in the mid 1800's. With the creation of Parker County, Weatherford was established as the county seat. Weatherford was a frontier outpost and maintained a central position at the intersection of both east-west and north-south roadways and railways. Prior to 1900, the City had already been operating water, power, and gas utilities. Originally, water was supplied by a large well at what is now Cherry Park. Later this was augmented by other wells. By the drought of the 1950's, Weatherford operated a number of water wells along with a treatment plant. The treatment plant utilized water from Sunshine Lake, an old railroad water refill lake for steam engines, located just northwest of town. During the drought of the 1950's, both the lake and well supplies became threatened, and Weatherford constructed Lake Weatherford northeast of town, which has since completely replaced wells and Sunshine Lake as municipal water sources. Until recently, a treatment plant near downtown treated the Lake Weatherford water for municipal use. In the last few years, Weatherford has annexed much of the area between the City and Lake Weatherford, and has constructed a new replacement treatment plant on the southwestern edge of the Lake. Part of this action has been in preparation for the future delivery of water from Lake Benbrook to this point. It should be noted that Weatherford's contract to purchase raw water from TRWD currently precludes them from wholesaling treated water to others. However, the contract does contain a provision which might be used to ease this restriction.

Weatherford is a Home Rule city. It has both a City Council and Municipal Utility Board. Technically, the Utility Board is subordinate to the Council. However, several of the positions on the Utility Board are held by City Council members such that only a few board decisions are not ratified by Council.

Weatherford is home to a fairly large public school district and a community college. In addition, Weatherford has several radio stations and a daily (except Saturday) newspaper, the Weatherford Democrat.

<u>ALEDO</u>

The City of Aledo was founded in 1882 as a railroad refueling point near the Clear Fork of the Trinity River. Prior to 1882, it was known as the community of Parker Station. Due to its position on the railroad, Aledo has always had a good mix of commercial and residential land use. The City has operated a number of water wells throughout the years, and their current municipal system is a mix of City developed wells and well systems installed by developers prior to land annexations. It is thought that some residential property owners may still have private wells.

As an older community, the Aledo area also has its own school district which services a majority of the study area. There is a weekly newspaper, the Community News, which serves the study area. The City of Aledo operates a small sewer treatment plant along with its water utilities. It is a General Law city and has collected property taxes for a number of years.

WILLOW PARK

The City of Willow Park was incorporated in 1964. This city extends from the east side of Lake Weatherford southward to the now defunct community of Chico. The south end of Willow Park borders the Bankhead Highway, one of the first coast to coast American paved roads. This highway has since been replaced by U.S. Highway 80 in the early 1940's and by Interstate 20 in the 1970's. Willow Park has primarily been a bedroom community to Fort Worth, and to Carswell Air Force Base (Fort Worth NAS/JRB) along with General Dynamics (Lockheed) in particular. General Dyamics/Lockheed has operated the Squaw Creek Recreation Center in the heart of Willow Park for its employees for several decades. Willow Park is home to one of Texas' few horse racing facilities, Squaw Creek Downs (formerly Trinity Meadows.)

Originally, Willow Park operated a portion of the old Chico water system and a separate water system just to the east of Lake Weatherford. Over time, the incorporation of several other private well systems and city wells were included to form a large system capable of supplying new subdivisions. A recent upgrade involves the connection of the main system, which is east of the Clear Fork, with the Willow Springs Oaks area, west of the Clear Fork.

Although Carswell and Lockheed are not as active as in times past, Willow Park has continued to grow rapidly due to its location on Interstate 20 and its proximity to Fort Worth. In addition, commercial growth continues along the Interstate highway. Recently, Willow Park has started serving a portion of this commercial Interstate corridor with sewer treatment. The remainder of the town remains on septic systems.

Willow Park is a General Law city with less than 5,000 population. It has only been within the last few years that Willow Park has started to collect property taxes.

Description of Supply, Source, Treatment, and Chemicals Used: Refer to system schematic. City of Willow Park is a community water system located in Parker County, TX. On the day of the investigation, City of Willow Park consisted of 1685 connections and 1685 meters, serving a population of approximately 5055 (based on 3 times the number of connections). Water is supplied to the City of Willow Park distribution through two separate pressure planes. Pressure Plane #1 consists of three pump stations and serves 1571 connections. The Ground Storage Pump Station receives water from Wells #1, 2, 3, 4, 5, 6P, 6T, 14, and 15. The raw water is chlorinated via gaseous chlorine. Subsequently, the water flows into two 0.5 MG ground storage tanks then is pumped into the distribution

through three 30HP/600GPM service pumps. The Fox Hunt Pump Station receives water from Wells #16T and 16P. The raw water is chlorinated via sodium hypochlorite. Subsequently, the water flows into a 0.03 MG ground storage tank then is pumped into the distribution through two 25HP/500GPM service pumps. The Willow Wood Pump Station secures water from Well # 11 and Willow Wood North and Willow Wood South. Raw water is chlorinated with sodium hypochlorite then flows into a 0.03 MG ground storage tank. The chlorinated water is sent into the distribution through three service pumps rated at 2HP/40GPM, 5HP/100GPM, and 10HP/200GPM each. Pressure is maintained via two 0.25 MG elevated storage tanks located at the Ground Storage Pump Station on 3517 Indian Camp and at the Fox Hunt Pump Station on 1109 Fox Hunt Trail. A pressure valve which normally remains closed connects both pressure planes.

WILLOW PARK MUNICIPAL SYSTEM - WILLOW PARK

October 24 07 to December 12 07 Inv

Page 3 of 19

Pressure Plane #2 consists of two pump stations and serves 114 connections south of I-20. The Willow Springs Pump Station secures water from the Willow Springs North and Willow Springs South wells. Raw water is chlorinated with sodium hypochlorite then flows into a 0.03 MG ground storage tank. The chlorinated water is sent into distribution through three 2.5HP/50GPM service pumps. The Willow Springs Oaks Pump Station secures water from the Willow Springs Oaks well. The raw water is treated with sodium hypochlorite and flows into a 0.06 MG ground storage tank. The water is sent into distribution through three 2.5HP/50GPM service pumps. Pressure is maintained via a 0.125 MG elevated storage tank located at the Willow Springs Oaks Pump Station.

The system has several emergency use only wells: #7, #9, #10, and El Chico Pump Station.

GENERAL INFORMATION

Mr. J. Lance Petty, Public Works Director, received prior notification of the investigation by Sandra Calderon-Garcia on September 20, 2007. A list of the information required for the investigation was sent via email to Mr. Petty. The investigation was conducted on October 18 and 24, 2006, with Mr. J. Lance Petty and Mr. Rudy L. Ragle.

The exit interview was conducted with Mr. Petty. The system had several documented violations at the time of the investigation.

4. ALLEGED VIOLATIONS

Track # 296397

§290.41(c)(3)(O)/§290.38(25) Facility Fencing

Failure to provide an intruder-resistant fence in order to protect Well #7, #9, and #11. In addition, wells #5, #4, and #3 must have a fence that is extending outward at a 45 degree angle. The fence must be at least six feet high and constructed of wood, concrete, masonry, or metal with three strands of barbed wire extending outward from the top of the fence at a 45 degree angle. In lieu of the barbed wire, the fence must be eight feet in height. The fence must be in good condition, and close enough to surface grade to prevent intruder passage, and kept locked when unattended. In lieu of a fence, wells, storage tanks, or pressure maintenance facilities may be installed in a vented, lockable building designed to prevent intruder access.

On the day of the investigation, Wells #7, #9, and #11 only had a 6 foot privacy fence without three strands of barbed wire. The well sites for #5, #4, and #3 did not have the top three metal strands extending outward at a 45 degree angle and some of the barbed wire and fencing was sagging and in disrepair. In addition, the Ground Storage Pump Station fence had some damaged barbed wire.

Track # 296399

§290.41(c)(3)(K) Ground Water Sources and Development Failure to seal the wellheads for Well # 9 (G1840027I) with the use of gaskets or a pliable crack-resistant caulking compound.

On the day of the investigation, it was noted that the wellhead for Wells #9 (G1840027I) was not properly sealed. Mr. Petty was advised to seal the wellhead to prevent contamination of the well water.

Track # 296401

§290.41(c)(3)(K) Ground Water Sources and Development

Failure to provide well #11 (G1840027K) with a screened casing vent, which must face downward and be elevated so as to minimize the drawing of contaminants into the well. The screening must be 16-mesh or finer corrosion-resistant screen.

On the day of the investigation, it was noted that the wellhead for Wells #11 (G1840027K) was not properly sealed. Mr. Petty was advised to install a proper vent to prevent contamination of the well water.

Track # 296402

§290.41(c)(1)(F)

Failure to make available sanitary control easements for all of the wells at the time of inspection, or executive director approval for a substitute authorized in §290.41(c)(1)(F)(iv). A sanitary easement, or approved substitute, covering all property within 150 feet of each well location must be secured from adjacent landowners and recorded at the county courthouse to ensure that hazards will not develop in each well area. Residential type wells within the easement must be constructed to public water well standards. A copy of the recorded document must be submitted for our records.

On the day of the investigation, the Willow Park Water System did not have copies of the sanitary easements available for review for any of the wells.

Track # 296405

§290.41(c)(3)(J) Ground Water Sources and Development

WILLOW PARK MUNICIPAL SYSTEM - WILLOW PARK

October 24 07 to December 12 07 Inv/

61191

Page 7 of 19

Failure to provide a concrete sealing block surrounding Well #9 (G1840027I) which extends at least three feet from the well casing in all directions, with a minimum thickness of six inches and sloped to drain away at not less than 0.25 inches per foot shall be provided around the wellhead.

On the day of the investigation, it was noted that the concrete sealing block on Well #9 (G1840027I) did not extend three feet from the well casing in all directions.

Track # 296407

§290.42(e)(4)(C) Disinfection

Failure to provide the chlorination room with both high level and floor level screened vents. If the room contains more than one operating 150 pound cylinder of chlorine, a fan which is located at and draws air in through the top vent and discharges to the outside atmosphere through the floor level vent must be provided, with the fan switch located outside the enclosure.

On the day of the investigation, it was noted that the chlorine room at the Ground Storage Pump Station did not have both high level and floor level screened vents. Instead the room had a screened window. There did appear to be a previously existing lower level screened vent; however, the vent had been covered with metal siding. Mr. Petty was advised to have two screened vents in working condition at all times.

Track # 296408

§290.42(I)

Failure to provide a Plant Operations Manual.

On the day of the investigation, the system had an incomplete plant operations manual. The manual was missing the local and federal emergency contact telephone numbers and the emergency protocols in the event of a man-made or natural catastrophe.

Track # 296409

§290.42(e)(5)

Failure to provide a solution container lid which must be properly covered and sealed to prevent the entry of dust, insects, and other contaminants.

On the day of the investigation, it was noted that the hypochlorinator at the Fox Hunt Pump Station was not covered properly. Mr. Petty was advised that the container must remain covered and sealed to prevent contamination.

Track # 296411

§290.43(c)(3) Design and Construction of Storage Tanks

Failure to provide a properly designed overflow pipe which is equipped with a gravity-hinged and weighted cover at the Willow Wood, Willow Springs, and Willow Springs Oaks Pump Station ground storage tanks. The cover must seat properly with a gap of no more than 1/16 inch.

On the day of the investigation it was noted that the ground storage tank overflow had a greater than 1/16 inch gap. Mr. Petty was advised that he would need to ensure there was no gap greater than 1/16 inches wide.

Track # 296412

§290.43(c)(4) Design and Construction of Storage Tanks

Failure to equip each of the ground storage tanks at the Ground Storage Pump Station with a water level indicator located at the tank site. The indicator may be a float with a moving target, an ultrasonic level indicator, or a pressure gauge calibrated in feet of water. Pressure gauges must be not less than 3 inches in diameter and calibrated at not more than 2 foot intervals.

On the day of the investigation, Mr. Ragle indicated that both of the 0.5 MG shared the water level indicator. Mr. Ragle was informed that each of the ground storage tanks would need to have their own water level indicators.

Track # 296414 §290.45(b)(1)(C)(iii) Capacity Requirements Failure to meet this Agency's "Minimum Water System Capacity Requirements." These requirements include: a well capacity of 0.6 gallons per minute per connection at Pressure Plane #1. Your water system must be modified to meet this requirement to assure an adequate supply of water at all times.

Please be advised that public water systems shall notify the executive director prior to making any significant change or addition to the system's production, treatment, storage, or distribution facilities. Public water systems shall submit plans and specifications for the proposed changes upon request.

The water system may request an exception to these requirements by writing to TCEQ, Water Supply Division, Public Drinking Water Section, Technical Review & Oversight, MC 155, P.O. Box 13087, Austin, TX 78711-3087; phone: (512) 239-4798.

On the day of the investigation, the system was providing a combined 837 GPM and was required to provide a minimum of 942.6 GPM

Track # 296417

§290.46(s)(1) Testing Equipment

Failure to calibrate flow measuring devices and rate-of-flow controllers that are required by §290.42(d) of this title at least once every 12 months.

On the day of the investigation, Mr. Petty indicated that the system did not have records of flow meter calibrations on the well meters.

Track # 296418

§290.46(m) Operating Practices for Public Water Systems

Failure to properly maintain all of the chlorine room doors located at each of the pump stations.

On the day of the investigation, it was noted that the doors for each of the pump station chlorine rooms were badly deteriorated with rust. Some of the doors were so rusted as to prevent proper closing of the doors.

Track # 296419

§290.46(t) Operating Practices for Public Water Systems

Failure to post a legible sign at each of its production, treatment, and storage facilities by each community system. The sign must be located in plain view of the public and must provide the name of the regulated entity and an emergency telephone number where a responsible official can be contacted.

On the day of the investigation, it was noted that the Fox Hunt PS not have an ownership sign on display.

Track # 296420

§290.46(n)(3) Engineering plans and maps

Failure to provide well completion data on the day of the investigation.

The system did not have the well data for Wells # 11, Willow Springs North, and Willow Springs South.

Track # 296422

§290.46(n)(2) Operating Practices for Public Water Systems

An accurate and up-to-date map of the distribution system shall be available so that valves and mains can be easily located during emergencies.

On the day of the investigation, the system did not have an up-to-date map of the distribution system available for review.

Track # 296424

§290.46(m)(4)

Failure to repair the leak on the 500 gallon pressure tank at the Willow Springs Pump Station.

One of the 500 gallon pressure tanks at pump station was leaking on the day of the investigation. Mr.

WILLOW PARK MUNICIPAL SYSTEM - WILLOW PARK

October 24 07 to December 12 07 Inv 611912

Page 9 of 19

Petty indicated that the leak would be repaired as soon as practicable.

Track # 296425

§290.46(f)(3)(B)(vi) Backflow, Siphonage

Failure to maintain backflow prevention assembly test and maintenance reports for a minimum of three years. The regulated entity must provide these records to Commission staff for inspection upon request.

On the day of the investigation, the system could not provide copies of the backflow prevention assemblies installed at the industrial park businesses. Mr. Ragle was advised to obtain copies for the system.

Track # 296427 §290.46(b)

Failure to submit adequate number of samples for microbiological analysis.

On the day of the investigation, the Willow Park Water System did not have complete copies of the bacteriological samples (laboratory analysis) available for review. Mr. Petty was informed that the system had to take a minimum of 6 samples per month to test for total and fecal coliform, specifically, five from Pressure Plane #1 and one from Pressure Plane #2.

Track # 296430

§290.46(m)(1)(A) Design and Construction of Storage Tanks

Failure to inspect both the ground storage and pressure tanks at least annually, to determine that the vents are in place and properly screened, the roof hatches closed and locked, flap valves and gaskets provide adequate protection

against insects, rodents, and other vermin, and that the interior and exterior coating systems are continuing to provide adequate protection to all metal surfaces and that the tank remains in a watertight condition. The results of these inspections must be recorded and maintained for at least five years, per §290.46(f)(3)(D)(ii). The records must be available for review by Commission staff during annual sanitary surveys of the system.

On the day of the investigation, the system had not conducted tank inspection reports for all of the ground storage, pressure tank, and elevated tanks. They system was informed that these inspections must be done on an annual basis.

Track # 296432 §290.46(j)

Failure to complete a customer service inspection certification on new connections.

On the day of the investigation, the system did not have any customer service inspection certificates available for review. Mr. Petty was advised that all new additions to the system were required to have a customer service inspection completed.

5. ALLEGED VIOLATIONS NOTED AND RESOLVED

Track # 296434

§290.121 Monitoring Plans

Failure by the regulated entity to develop and maintain an up to date system monitoring plan. The plan shall identify all bacteriological and chemical sampling locations, describe the sampling frequency, and specify the analytical procedures and laboratories to be used to comply with monitoring requirements. The completed plan must be retained at each water plant, and made available to agency personnel for review during succeeding sanitary surveys.

On the day of the investigation it was noted that the system did not have a monitoring plan available for review.

Resolution: On October 24, 2007, Mr. Petty hand-delivered a copy of the system's Monitoring Plan. This information appears to adequately resolve the alleged violation.

30 TAC Chapter 290.38(25) 30 TAC Chapter 290.41(c)(3)(O)

Alleged Violation:

Investigation: 611912

Comment Date: 12/12/2007

Failure to provide an intruder-resistant fence in order to protect Well #7, #9, and #11. In addition, wells #5, #4, and #3 must have a fence that is extending outward at a 45 degree angle. The fence must be at least six feet high and constructed of wood, concrete, masonry, or metal with three strands of barbed wire extending outward from the top of the fence at a 45 degree angle. In lieu of the barbed wire, the fence must be eight feet in height. The fence must be in good condition, and close enough to surface grade to prevent intruder passage, and kept locked when unattended. In lieu of a fence, wells, storage tanks, or pressure maintenance facilities may be installed in a vented, lockable building designed to prevent intruder access.

§290.38(25) Intruder-resistant fence — A fence six feet or greater in height, constructed of wood, concrete, masonry, or metal with three strands of barbed wire extending outward from the top of the fence at a 45 degree angle with the smooth side of the fence on the outside wall. In lieu of the barbed wire, the fence must be eight feet in height. The fence must be in good repair and close enough to surface grade to prevent intruder passage. [§290.41(c)(3)(O)] All completed well units shall be protected by intruder-resistant fences, the gates of which are provided with locks or shall be enclosed in locked, ventilated well houses to exclude possible contamination or damage to the facilities by trespassers. The gates or wellhouses shall be locked during periods of darkness and when the plant is unattended.

Recommended Corrective Action: Submit photographs demonstrating that the fence and barbed wire at each of the well sites and pump stations is in accordance with 30 TAC §290.41(c)(3)(O) and §290.38(25).

Track No: 296402 Compliance Due Date: 04/03/2008

30 TAC Chapter 290.41(c)(1)(F)

Alleged Violation:

Investigation: 611912 Comment Date: 12/12/2007

Failure to make available sanitary control easements for all of the wells at the time of inspection, or executive director approval for a substitute authorized in §290.41(c)(1) (F)(iv). A sanitary easement, or approved substitute, covering all property within 150 feet of each well location must be secured from adjacent landowners and recorded at the county courthouse to ensure that hazards will not develop in each well area. Residential type wells within the easement must be constructed to public water well standards. A copy of the recorded document must be submitted for our records.

§290.41(c)(1)(F) A sanitary control easement or sanitary control easements covering land within 150 feet of the well, or executive director approval for a substitute authorized by this subsection, shall be obtained. [§290.41(c)(1)(F)(i)] The sanitary control easement(s) secured shall provide that none of the pollution hazards covered in subparagraphs (A) - (E) of this paragraph, or any facilities that might create a danger of pollution to the water to be produced from the well, will be located thereon. [§290.41(c)(1)(F)(ii)] For the purpose of a sanitary control easement, an improperly constructed water well is one which fails to meet the surface and subsurface construction standards for public water supply wells. Residential type wells within a sanitary control easement must be constructed to public water well standards. [\$290.41(c)(1)(F)(iii)] A copy of the recorded sanitary control easement(s) shall be included with plans and specifications submitted to the executive director for review. [§290.41(c)(1)(F)(iv)] With the approval of the executive director, the public water system may submit any of the following as a substitute for obtaining, recording, and submitting a copy of the recorded sanitary control easement(s) covering land within 150 feet of the well: [§290.41(c)(1)(F)(iv)(I)] a copy of the recorded deed and map demonstrating that the public water system owns all real property within 150 feet of the well; [§290.41(c)(1)(F)(iv)(II)] a copy of the recorded deed and map demonstrating that the public water system owns a portion of real property within 150 feet of the well. and a copy of the sanitary control easement(s) that the public water system has obtained, recorded, and submitted to the executive director applicable to the remaining portion of real property within 150 feet of the well not owned by the public water system; or [§290.41(c)(1)(F)(iv)(III)] for a political subdivision, a copy of an ordinance or land use restriction adopted and enforced by the political subdivision which provides an equivalent or higher level of sanitary protection to the well as a sanitary control easement. [§290.41(c)(1)(F)(v)] If the executive director approves a sanitary control easement substitute identified in clause (iv)(I) or (iv)(II) of this

subparagraph for a public water system and the public water system conveys the property it owns within 150 feet of the well to another person or persons, the public water system must at that time obtain, record, and submit to the executive director a copy of the recorded sanitary control easement(s) applicable to the conveyed portion of the property within 150 feet of the well, unless the executive director approves a substitute identified in clause (iv) of this subparagraph.

Recommended Corrective Action: Submit a photocopy of the recorded sanitary control easements OR a photocopy of the approved substitute OR a granted exception request from the Water Supply Division.

Resolution:

Alleged Violation:

Investigation: 611912 Comment Date: 12/12/2007

Failure to meet this Agency's "Minimum Water System Capacity Requirements." These requirements include: a well capacity of 0.6 gallons per minute per connection at Pressure Plane #1. Your water system must be modified to meet this requirement to assure an adequate supply of water at all times.

Please be advised that public water systems shall notify the executive director prior to making any significant change or addition to the system's production, treatment, storage, or distribution facilities. Public water systems shall submit plans and specifications for the proposed changes upon request.

The water system may request an exception to these requirements by writing to TCEQ, Water Supply Division, Public Drinking Water Section, Technical Review & Oversight, MC 155, P.O. Box 13087, Austin, TX 78711-3087; phone: (512) 239-4798.

§290.45 Minimum Water System Capacity Requirements. §290.45(b) Community water systems. [§290.45(b)(1)(C)] For 50 to 250 connections, the system must meet the following requirements: §290.45(b)(1)(D) For more than 250 connections, the system must meet the following requirements:

§290.45(b)(1)(D)(i) two or more wells having a total capacity of 0.6 gpm per connection. Where an interconnection is provided with another acceptable water system capable of supplying at least 0.35 gpm for each connection in the combined system under emergency conditions, an additional well will not be required as long as the 0.6 gpm per connection requirement is met for each system on an individual basis. Each water system must still meet the storage and pressure maintenance requirements on an individual basis unless the interconnection is permanently open. In this case, the systems' capacities will be rated as though a single system existed;

Recommended Corrective Action: Submit documentation demonstrating the system is providing a total well capacity of 0.6 GPM per connection for Pressure Plane #1.

Monitoring Plan for the

City of Willow Park

516 Ranch House Rd. Willow Park, TX 76087

Date of Monitoring Plan: October 18, 2007 PWS ID 1840027 PARKER COUNTY, TEXAS Responsible Official: Lance Petty – Director of Public Works Water Supply Contact: Rudy Ragle, Superintendent, 817-441-2812

The City of Willow Park owns and operates 22 water wells, and sells water to the citizens of Willow Park. This system serves 5,897 people, with 1,685 connections.

The City of Willow Park has 22 wells: well 1, well 2, well 3, well 4, well 5, well 6p, well 6t, well 7, well 8, well 9, well 10, well 11, well 14, well 15, well 16p, well 16t, WWN, WWS, El Chico, WSN, WSS, WSO. All wells are active except for well 8 (plugged), and El Chico. Well's 7, 9, 10, and El Chico can be used in emergency situations. The well water is pumped into collection lines to storage tanks throughout the water system. The water system has 6 pump stations, 16 total booster pumps, with the three at El Chico for emergency purposes. The system has 3 elevated storage tanks that equal 625,000 gallons of storage, with 7 ground storage tanks that equal 1,180,000 gallons of storage equaling 1,805,000 gallons of total storage. The system consists of 2 pressure plains.

A. RAW WATER SAMPLING

WE ARE NOT REQUIRED TO TAKE RAW WATER SAMPLES.

B. IN - PLANT SAMPLING

WSN	Liquid Chlorine	Ground storage tanks
WSS		
MGO		
WSO	Liquid Chlorine	Ground storage tanks

Chlorine residuals are taken daily at all treatment sites and are recorded on the DLQOR reports.

C. Entry point Sampling

1. Disinfectant entering the distribution system

This system is in compliance if the free chlorine residual entering the distribution system is over 0.2 mg/l.

2. Organics, In-organics, and Radio-chemicals.

- a. Frequency
 The TCEQ'S sampling contractor collects these samples: Letters are attached.
- b. Location Entry point 011, 010, 001
- c. Samples are sent to the Texas Department of State Health Services.

D. Distribution System Sampling

The distribution system consists of collection lines that carry the ground water to the storage facilities for treatment. The source of water is ground from the upper and lower Trinity aquifer's, once the water is into the storage facilities, then the water is treated with either liquid cl2 or gas cl2, then is pumped into the distribution system. The system consist of two pressure plains, one plain is north of Interstate I-20 and one is south of Interstate I-20. North of I-20 the system has 13 wells, and 500,000 gallons of overhead storage capacity and 1,000,060 gallons of ground storage capacity. Well's 7, 9, 10 and El Chico wells on emergency basis only. South of I-20 the system has 4 well's and 125,000 gallons of overhead storage capacity, and 90,000 gallons of ground storage capacity. The system south of I-20 has a interconnect valve at the corner of Bankhead Rd. and Kingswood Dr. this interconnect valve is in the open position.

1. Coli form Samples

The system collects four coli form samples per month. These samples are collected during the first week of every month, the location of the samples are listed below:

- a. 138 Northchase south on Crown Rd., turn left onto Ranch House Rd. (s. east), turn left onto Northchase. Pull sample at 138 Northchase.
- b. 374 Spyglass south on Crown Rd., turn left onto Ranch House Rd. (s. east), cross under I-20, turn left on Bankhead Rd. go east, turn left onto Pebble Beach, turn left onto Spyglass. Pull sample at 374 Spyglass.
- c. 101 Stagecoach Trail south on Crown Rd., turn left onto Ranch House Rd. (s. east), turn right (west) onto Stagecoach Trail. Pull sample at 101 Stagecoach Trail.

- d. 500 Deer Pond- south on Crown Rd., turn left onto Mikus Rd. (south), go under I-20, turn right onto Deer Pond. Pull sample at 500 Deer Pond.
- e. 108 Kingwood south on Crown Rd., turn left onto Mikus Rd. (south), go under I-20, turn left onto I-20 Service Rd. eastbound, turn right onto Kingswood. Pull sample at 108 Kingswood.
- f. Samples are sent to the Tarrant County Public Health Department for analysis. Phone number is 817-321-4750

2. Disinfectant Residual - Free

- a. Residuals are taken daily and recorded on the DLQOR reports.
- **b.** The daily residuals are taken daily from every pump station's and storage facilities.
- c. Hach colorimeter is used to measure disinfectant residual.
- d. This system reports the DLQOR report to the TCEQ quarterly.

3. Disinfection Byproducts (DBP'S) -TTHM and HAA5

This system has more than one entry point.

3. Lead - Copper

- a. Frequency testing (state notification)
- b. Location: Pressure plain north of I-20
- 801 Sam Bass
- 805 Kingsgate
- 3308 Camelot
- 733 Royal View Ct.
- 152 Regent Row Ct.
- 316 Fairway
- 509 Willow Park Dr.

- 101 Stagecoach Tr.

Pressure Plain south of I-20

- 4825 Quail Crest
- 116 Kingswood
- 608 Deer Pond
- 504 Big Creek
- 109 Circle Dr.

E. Lab Approval Form - N/A

1. ENTRY POINT SAMPLING

a. List of entry point

Entry point	Sample site	Source	Plant name
001	Hose bib on house	Trinity aquifer	Wells 1, 2, 3, 4, 5, 6p,
010	Hose bib on house		6t, 14, 15, 16p, 16t, 11,
011	Hose bib on house		WWN, WWS

2. Disinfectant entering the distribution system

Our system uses both liquid and gas chlorine. There is chlorine at every storage facility and at every emergency well head. The City of Willow Park provides water with a chlorine residual throughout the distribution system.

- a. We record a chlorine residual at every storage facility daily.
- b. The residual is measured at every entry point in the system.
- c. Each entry point is equipped with self priming D10 chlorine pumps.
- d. Chlorine is measured using the Hach colorimeter.
- e. The system is in compliance if the free chlorine residual is over 0.2 mg/l, we maintain a residual of at least 1.0 at each entry point.

3. Organic chemicals, In-organic chemicals, and radio-chemicals

- a. The TCEQ sampling contractor collects theses samples.
- b. The TCEQ will notify system of violations

4. Chlorine Dioxide

We do not use chlorine dioxide.

5. Chlorite

We do not use chlorine dioxide, so this requirement does not apply to us.

6. Bromate

We do not use ozone, so this requirement does not apply to us.

D. Distribution System Sampling

The main distribution system is the City of Willow Park. There are sampling locations at four areas in the system.

1. Coil form Samples

List of coli form sampling sites

Site no.	Address	Mo. Sampled for coli form
Α	138 Northchase	Jan/Mar/May
B	108 Kingswood	July/Sep/Nov
С	101 Stagecoach	monthly
D	500 Deer Pond	Feb/Apr/June
F.	374 Spyglass	Aug/ Oct/ Dec

We are required to take 3 coli form samples a month. We are required to have 5 coli form sample sites, we use 5 to be sure we check the whole system.

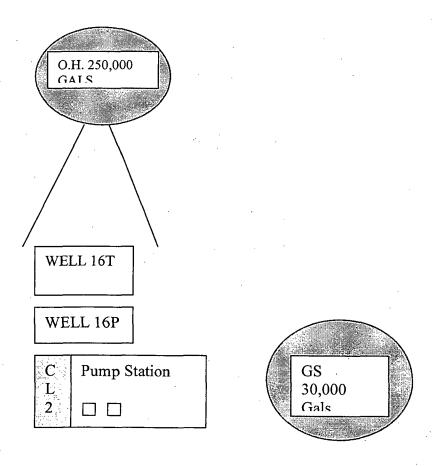

- A. Location: samples are cycled as shown in table above.
- B. Method: Coli form samples are sent to: Tarrant County Public Health1101 S. Main St. Ft. Worth, TX 76104 USEPA LAB NO. 01471 817-321-4750

WSO – 57 GPM

Note: The Willow Springs plant and the Willow Springs Oaks plants have a interconnect valve at the corner of Bankhead and Kingswood Rd. This valve is in the open position.

Note: El Chico is on emergency basis only and is chlorinated at the storage.

Note: Well's 7, 9, and 10 are used on emergency basis only and are chlorinated at the well head.

Well 8 is Plugged. See: Plugged report attached to Monitoring Plan.

2. DISINFECTANT RESIDUAL - FREE OR TOTAL CHLORINE

List of Disinfectant Sampling Sites

Site no.	Address		Days sampled
a.	3500 Indian Camp	(ground storage)	Daily
b.	1109 Fox Hunt	(Fox Hunt)	Daily
С.	3324 Forrest Circle	(Willow Wood)	Daily
d.	117 Circle	(Willow Springs Oaks)	Daily
e.	4821 Quail Crest	(Willow Springs)	Daily

The disinfectant residual is measured on a daily basis. The residual is measured using the Hach colorimetric method.

Disinfectant residuals are reported quarterly to the TCEQ on the DLQOR Report.

The system is in compliance with the minimum residual requirement if the free chlorine residual throughout the distribution system is greater than 0.2 mg/l.

The system is in compliance with the maximum residual disinfectant limit if the running annual average of all samples taken in the distribution system is less than 4.0 mg/l.

SUBJECT: Public Drinking Water System - WILLOW PARK MUNICIPAL SYSTEM

Year 2009 Chemical Sampling Schedule and Cost ESTIMATE, and Monitoring Frequency Status Report

(THIS IS NOT A BILL)

Dear Water System Official:

Enclosed are reports of sampling requirements and sample collection schedules for your water system, along with an estimate of analysis costs during calendar year 2009.

- * The first report, titled "Monitoring Frequency Status," describes all of your system's current chemical monitoring required by the Texas Administrative Code (TAC) Chapter 30, Subchapter F. The second report, titled "Year 2009 Estimated Chemical Sampling Costs," lists the type and approximate analysis cost for each sample currently scheduled for 2009. This is only an estimate. DO NOT SEND PAYMENT TO TCEQ.
- * The "Explanation for CHEMICAL SAMPLE COST ESTIMATE AND MONITORING FREQUENCY STATUS REPORTS" is also enclosed and available online at <www.tceq.state.tx.us/goto/pws/sampling/key>.
- * TCEQ collects chemical samples through a sampling contractor: Delta Consultants (Delta) at (512) 990-7467, (800) 477-7411, or http://www.deltaenv.com. A Delta representative will contact you to schedule a sampling appointment. A water system official must accompany the sampler during collection.
- * You should attach a copy of this letter and reports to your Monitoring Plan for reference.

You must keep chemical records for ten years and update your contact information.

You must be prepared to make these records available to the general public and TCEQ upon request. If your system has a change in ownership, responsible official, address, phone number, etc., you must inform the TCEQ in writing. This information can be viewed using the Integrated Water Utilities Database (iWUD) on the internet at http://www10.tceq.state.tx.us/iwud/. If any information in iWUD is incorrect for your system, please notify us by email at: pdws@tceq.state.tx.us, or by mail at the letterhead address.

You must maintain an up-to-date monitoring plan that lists sample sites and indicates them on a map.

Your system's operator must have the Monitoring Plan available for the Delta sample collector at each sampling event. Failure to do so is a violation. On the web, search "Monitoring Plan" from TCEQ's home page for more information.

Your chemical compliance samples (except for lead and copper samples) are collected by Delta or its subcontractor in the North office and shipped to the LCRA laboratory in Austin. The laboratory will send you the sample results and a bill for the cost of analysis. If you have billing questions, please contact LCRA at (512) 356-6022 directly. All radionuclide sampling will be analyzed and billed from DSHS laboratories. UCMR samples will be analyzed and billed by LCRA. Lead and copper samples will be collected by your customers and should be shipped for analysis to LCRA at (877) 362-5272 (toll free). Monthly coliform monitoring in distribution will continue to be collected by your staff and shipped to an accredited lab of your choice. Refusing sample collection or failing to pay for analyses will result in monitoring violations and revocation of reduced monitoring waivers.

If you have any questions about this letter or report, please contact the Drinking Water Quality Team by email with Subject: "Sample Cost Estimate Letter" at <pd>pdws@tceq.state.tx.us

Sincerely,
Drinking Water Quality Team

Pete Wehner - Fwd: Priority 48 hr VOC Results

From:

Gary Regner

To:

Pete Wehner; Sean Ables; Tom Weber

Date:

5/9/2006 8:28 AM

Subject: Fwd: Priority 48 hr VOC Results

Here are the follow up results for Willow Park MS. The sample was directly from the well.

Thank you

Gary Regner
Quality Assurance Specialist
Sample Contract Manager
Drinking Water Quality Team

PWS: 1840027 Analysis: VOC TCEQ ID: 0692514 Sampled: 5/4/06 10:00 Received: 5/5/06 07:00

Please note that the VOC's have an exceedence for Trichloroethene (TCE) and this paperwork will follow later today.

Please see attached the Final Results and Submission Forms below.

Please feel free to call if you require any further assistance. Have a safe and blessed day.

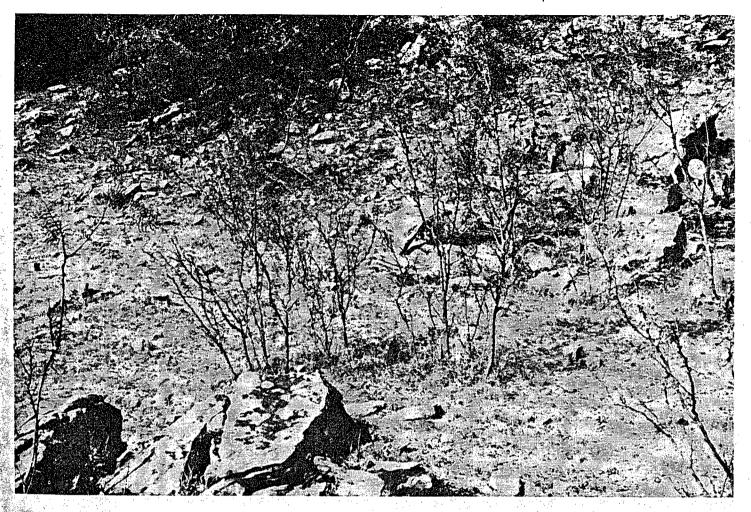

Figure 7.—Bonti and Truce soils, 1 to 8 percent slopes. Sandstone outcrop in foreground.

subangular blocky structure; hard, firm; common very fine roots and pores; many very fine threads and films of calcium carbonate; calcareous, moderately alkaline; gradual, wavy boundary.

IIBb-55 to 60 inches, brown (10YR 5/3) sandy clay loam, brown (10YR 4/3) moist; massive; very hard, friable; many films, threads, and soft masses of calcium carbonate; calcareous, moderately alkaline.

The A horizon is dark grayish brown, grayish brown, brown, dark brown, or very dark grayish brown. It is 20 to 35 inches thick.

The B2 horizon is brown, grayish brown, or light brownish gray. It is fine sandy loam, loam, or clay loam.

The depth to the buried horizon is 24 to more than 60

inches.

Bo-Bosque loam, occasionally flooded. This nearly level soil is on bottom land that is occasionally flooded. Mapped areas are elongated and follow the contour of drainageways. Areas range from 5 to more than 200 acres in size, but average about 25 acres. Slopes are 0 to 1 percent.

Included with this soil in mapping is a soil that is similar to the Bosque soil but has a lighter colored surface layer; a few areas of fine sandy loam; small areas of Blanket, Krum, and Venus soils along slightly higher Positions; and small areas of Bunyan and Frio soils Also included are small areas of a soil that is similar to the Bosque soil but has less than 24 inches of recent overburden. Inclusions make up less than 20 percent of any one mapped area.

The hazard of water erosion is slight, but soil areas are subject to flooding. They are flooded as often as one or more times in 4 to 10 years, mainly in May or September. Most areas are flooded for 24 hours or less.

Most of the acreage is for crops. Some areas are established to pasture. Capability unit IIw-1; Loamy Bottom Land range site; pasture group 2A.

Brackett Series

The Brackett series consists of shallow, gently sloping to steep, calcareous loamy soils on uplands. These soils formed in material weathered from interbedded limestone and calcareous clay loam.

In a representative profile the surface layer is light brownish-gray, calcareous clay loam about 4 inches thick. The next 10 inches is light-gray calcareous loam. The underlying material is weakly cemented limestone and calcareous pale-yellow clay loam.

These soils are well drained. Runoff is rapid. Permeability is moderately slow, and the available water capacity is very low.

Brackett soils are used mainly as range. A few areas in and near Weatherford are used for urban development.

Representative profile of Brackett clay loam, in an area of Brackett and Maloterre soils, 3 to 12 percent slopes, 5.3 miles southwest of Springtown via Farm Road 51, then 0.7 mile west, then north and east 2 miles on county road, then west of road 75 feet from fence:

A1-0 to 4 inches, light brownish-gray (10YR 6/2) clay loam, brown (10YR 5/3) moist; moderate, fine, granular structure; hard, friable; many fine pores; few fossil shells and rock fragments; about 60 percent calcium carbonate equivalent; calcareous, mod-

erately alkaline; clear, wavy boundary. B2-4 to 14 inches, light-gray (10YR 7/2) loam, pale brown (10YR 6/3) moist; moderate, medium, subangular blocky structure; hard, friable; few pores; 60 percent calcium carbonate equivalent; common fine calcium carbonate concretions and limestone shell fragments; calcareous, moderately alkaline; abrupt, wavy boundary.

C-14 to 30 inches, thinly interbedded, weakly and strongly cemented fossil limestone and calcareous pale-

yellow clay loam.

The soil is 5 to 35 percent coarse limestone fragments and more than 40 percent calcium carbonate. The A horizon is 3 to 12 inches thick. It is light brownish gray, light gray grayish brown, or brown and is clay loam, loam, or gravelly

The B horizon is 4 to 16 inches thick. It is light gray light brownish gray, pale yellow, yellowish brown, light

yellowish brown, very pale brown, or pale brown.

Depth to the C horizon is 10 to 20 inches. It is light brownish gray, very pale brown, or pale yellow and is loam, clay loam, or marl intermixed with limestone fragments.

BrE—Brackett-Urban land complex, 3 to 12 percent slopes. This mapping unit occurs as gently sloping to strongly sloping breaks throughout the city of Weatherford. It is about 45 percent Brackett soils, 20 percent Urban land, and 35 percent soils of minor extent. Areas are long and irregular in shape and follow the contour of ridges and other landforms. They range from 5 to more than 150 acres in size.

In an undisturbed area Brackett soil has a surface layer of light brownish-gray gravelly clay loam about 4 inches thick. The next 10 inches is light-gray loam. The underlying material is limestone and pale-yellow

clay loam.

Urban land is developed for single-unit dwellings and streets, driveways, sidewalks, and patios. Small businesses and paved parking lots are in a few areas. Most structures are on the less sloping narrow ridges and foot slopes.

Included with this unit in mapping are small areas of Aledo, Maloterre, and Purves soils on ridgetops and small areas of Bolar, Lamar, and Venus soils on foot slopes. Also included are a few rock outcrops along

ridgetops.

Urban development has been less on this mapping unit than elsewhere in the county. Where urban structures have been planned, soils and landforms were altered to prepare sites, create trafficways, or provide a better environment for growing lawns and landscape plants. Cuts and fills 2 to 6 feet deep were made in places to prepare building foundations or to level yards. Stones were removed, and yards were topdressed with imported soil. The main concern in urban development is shaping the underlying limestone and marl preparatory to site leveling, street construction, or trenching for utilities. Other limitations are slope, stoniness, and

seasonal seepage. Not assigned to a capability unit.

range site, or pasture group.

BsE-Brackett and Majoterre soils, 3 to 12 percent slopes. This gently sloping to strongly sloping mapping unit is on upland ridges. Areas are longer than they are wide and follow the contour of hills and ridges (fig. 8). Areas range from 5 to 400 acres in size, but are mostly about 70 acres.

Average composition of this mapping unit is 50 percent Brackett soil, 22 percent Maloterre soil, and 28 percent soils of minor extent, but composition is variable. Brackett soils are dominant and make up 40 to 80 percent of mapped areas. They are along side slopes and usually have a slope of 5 to 12 percent. Maloterre soils, where present, make up 10 to 40 percent of the mapped areas. They are along the more nearly level ridgetops and usually have a slope of 3 to 5 percent.

Brackett soils have the profile described as representative of the Brackett series. They are as much as 35 percent limestone gravel, cobbles, and fossil fragments. Maloterre soils have a surface layer of grayishbrown gravelly clay loam about 8 inches thick. The underlying material is indurated limestone that con-

tains many fossil shells.

Included with this unit in mapping are a few small areas where slopes are as much as 20 percent; areas of a soil that is similar to Brackett soil but that contains more coarse limestone fragments; small areas of Bolar, Lamar, and Venus soils along foot slopes; and small areas of Aledo soils along slightly higher ridges.

Most of this mapping unit is used as range. It is also suited to cultivation. The hazard of water erosion is moderate. Capability unit VIs-1; Steep Adobe range

site; not assigned to a pasture group.

BsG—Brackett and Maloterre soils, 12 to 30 percent slopes. This moderately steep to steep mapping unit is on ridges and hills in the uplands. Areas are elongated and follow the contour of sloping ridges. They range from 10 to more than 50 acres in size, but average about 30 acres.

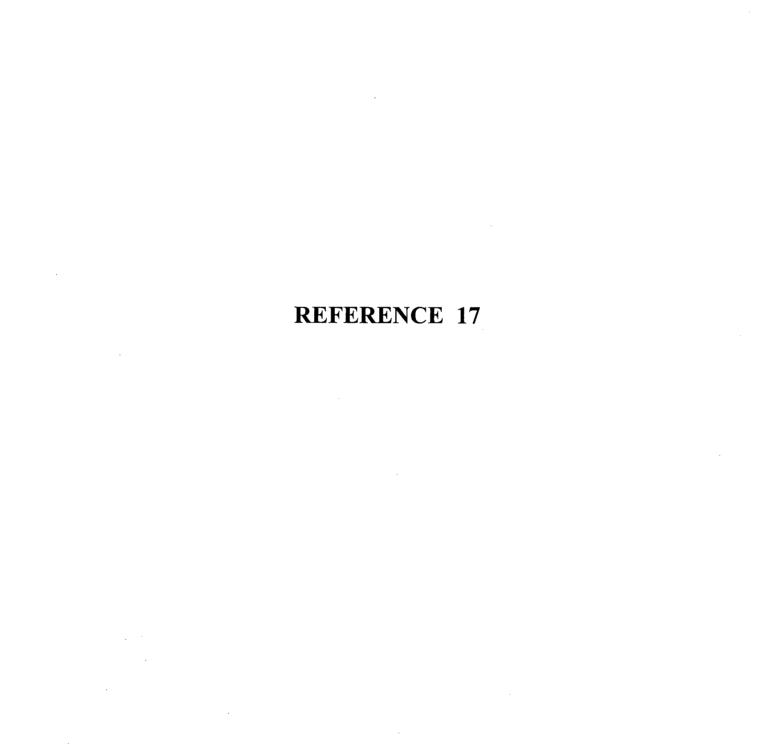

Average composition of this mapping unit is 57 percent Brackett soils, 20 percent Maloterre soils, and 23 percent soils of minor extent, but composition is variable. Brackett soils are dominant and make up 40 to 80 percent of the unit. They are on the more sloping sides of ridges. Maloterre soils, where present, make up 10 to 30 percent of areas. They are along ridgetops.

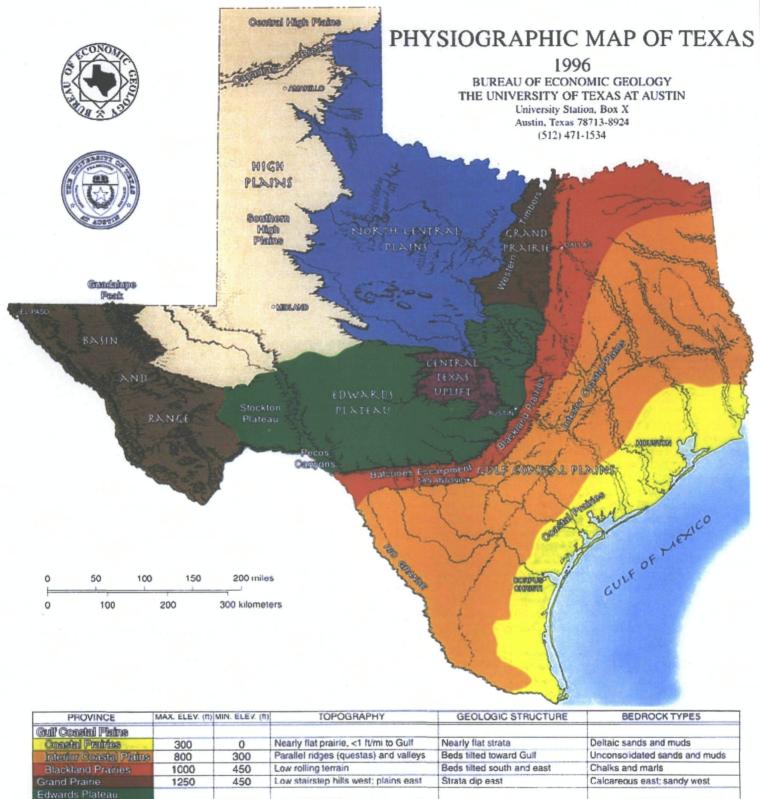

Brackett soils contain as much as 35 percent gravel and cobble-size fragments. As much as 35 percent of their surface is covered by limestone gravel, cobbles, and shell fragments. The surface layer is grayish-brown clay loam about 4 inches thick. The next 12 inches is light yellowish-brown clay loam. The underlying material is calcareous pale-yellow marl.

Maloterre soils have a surface layer of grayish-brown gravelly clay loam about 4 inches thick. The underlying material is indurated limestone and imbedded fossil

Included with this unit in mapping are small areas where slopes are less than 12 percent; areas of a soil that is similar to Brackett soil but that contains more coarse fragments; small areas of Bolar, Lamar, and Venus soils along foot slopes; and small areas of Aledo and Purves soils along narrow ridges.

PROVINCE	MAX. ELEV. (ft)	MIN. ELEV. (ft)	TOPOGRAPHY	GEOLOGIC STRUCTURE	BEDROCK TYPES
Guil Constal Plains					
Constel Pretiries	300	0	Nearly flat prairie, <1 ft/mi to Gulf	Nearly flat strata	Deltaic sands and muds
Interior Coastal Plains	800	300	Parallel ridges (questas) and valleys	Beds tilted toward Gulf	Unconsolidated sands and muds
Blackland Prairies	1000	450	Low rolling terrain	Beds tilted south and east	Chalks and marls
Grand Prairie	1250	450	Low stairstep hills west; plains east	Strata dip east	Calcareous east; sandy west
Edwards Plateau					
Principal	3000	450	Flat upper surface with box canyons	Beds dip south; normal faulted	Limestones and dolomites
Pecos Canyons	2000	1200	Steep-walled canyons		Limestones and dolomites
Stockton Plateau	4200	1700	Mesa-formed terrain; highs to west	Unfaulted, near-horizontal beds	Carbonates and alluvial sediments
Central Texas Uplift	2000	800	Knobby plain; surrounded by questas	Centripetal dips, strongly faulted	Granites; metamorphics; sediments
North Central Plains	3000	900	Low north-south ridges (questas)	West dip; minor faults	Limestones; sandstones; shales
High Plains					
Cantral	4750	2900	Flat prairies slope east and south	Slight dips east and south	Eolian silts and fine sands
Canadian Breaks	3800	2350	Highly dissected; local solution valleys		
Southern	3800	2200	Flat; many playas; local dune fields		
Basin and Range	8750	1700	North-south mountains and basins	Some complex folding and faulting	Igneous; metamorphics; sediments

Geologists study the natural scenery of Texas and sort its variations into distinctive physiographic provinces. Each province or landscape reflects a unified geological history of depositional and erosional processes. Each physiographic province is distinguished by characteristic geologic structure, rock and soil types, vegetation, and climate. The elevations and shapes of its landforms contrast significantly with those of landforms in adjacent regions. The Physiographic Map of Texas displays seven physiographic provinces and their principal subdivisions; the accompanying table describes their major physical differences. The following descriptions selectively emphasize those characteristics that distinguish provinces and their subdivisions.

Gulf Coastal Plains. The Gulf Coastal Plains include three subprovinces named the Coastal Prairies, the Interior Coastal Plains, and the Blackland Prairies. The Coastal Prairies begin at the Gulf of Mexico shoreline. Young deltaic sands, silts, and clays erode to nearly flat grasslands that form almost imperceptible slopes to the southeast. Trees are uncommon except locally along streams and in oak mottes, growing on coarser underlying sediments of ancient streams. Minor steeper slopes, from 1 foot to as much as 9 feet high, result from subsidence of deltaic sediments along faults. Between Corpus Christi and Brownsville, broad sand sheets pocked by low dunes and blowouts forming ponds dominate the landscape.

The Interior Coastal Plains comprise alternating belts of resistant uncemented sands among weaker shales that erode into long, sandy ridges. At least two major down-to-the-coast fault systems trend nearly parallel to the coastline. Clusters of faults also concentrate over salt domes in East Texas. That region is characterized by pine and hardwood forests and numerous permanent streams. West and south, tree density continuously declines, pines disappear in Central Texas, and chaparral brush and sparse grasses dominate between San Antonio and Laredo.

On the Blackland Prairies of the innermost Gulf Coastal Plains, chalks and marls weather to deep, black, fertile clay soils, in contrast with the thin red and tan sandy and clay soils of the Interior Gulf Coastal Plains. The blacklands have a gentle undulating surface, cleared of most natural vegetation and cultivated for crops.

From sea level at the Gulf of Mexico, the elevation of the Gulf Coastal Plains increases northward and westward. In the Austin—San Antonio area, the average elevation is about 800 feet. South of Del Rio, the western end of the Gulf Coastal Plains has an elevation of about 1,000 feet.

Grand Prairie. The eastern Grand Prairie developed on limestones; weathering and erosion have left thin rocky soils. North and

Physiography of Texas

west of Fort Worth, the plateaulike surface is well exposed, and numerous streams dissect land that is mostly flat or that gently slopes southeastward. There, silver bluestem—Texas wintergrass grassland is the flora. Primarily sandstones underlie the western margin of the Grand Prairie, where post oak woods form the Western Cross Timbers.

Edwards Plateau. The Balcones Escarpment, superposed on a curved band of major normal faults, bounds the eastern and southern Edwards Plateau. Its principal area includes the Hill Country and a broad plateau. Stream erosion of the fault escarpment sculpts the Hill Country from Waco to Del Rio. The Edwards Plateau is capped by hard Cretaceous limestones. Local streams entrench the plateau as much as 1,800 feet in 15 miles. The upper drainages of streams are waterless draws that open into box canyons where springs provide permanently flowing water. Sinkholes commonly dot the limestone terrane and connect with a network of caverns. Alternating hard and soft marly limestones form a stairstep topography in the central interior of the province.

The Edwards Plateau includes the Stockton Plateau, mesalike land that is the highest part of this subdivision. With westward-decreasing rainfall, the vegetation grades from mesquite—juniper brush westward into creosote bush—tarbush shrubs.

The Pecos River erodes a canyon as deep as 1,000 feet between the Edwards and Stockton Plateaus. Its side streams become draws forming narrow blind canyons with nearly vertical walls. The Pecos Canyons include the major river and its side streams. Vegetation is sparse, even near springs and streams.

Central Texas Uplift. The most characteristic feature of this province is a central basin having a rolling floor studded with rounded granite hills 400 to 600 feet high. Enchanted Rock State Park is typical of this terrain. Rocks forming both basin floor and hills are among the oldest in Texas. A rim of resistant lower Paleozoic formations (see the *Geology of Texas* map) surrounds the basin. Beyond the Paleozoic rim is a second ridge formed of limestones like those of the Edwards Plateau. Central live oak—mesquite parks are surrounded by live oak—ashe juniper parks.

North-Central Plains. An erosional surface that developed on upper Paleozoic formations forms the North-Central Plains. Where shale bedrock prevails, meandering rivers traverse stretches of local prairie. In areas of harder bedrock, hills and rolling plains dominate. Local areas of hard sandstones and limestones cap steep slopes severely dissected near rivers. Lengthy dip slopes of strongly fractured limestones display extensive rectangular patterns. Western rocks and soils are oxidized red or gray where gypsum dominates, whereas

eastern rocks and soils weather tan to buff. Live oak-ashe juniper parks grade westward into mesquite-lotebush brush.

High Plains. The High Plains of Texas form a nearly flat plateau with an average elevation approximating 3,000 feet. Extensive stream-laid sand and gravel deposits, which contain the Ogallala aquifer, underlie the plains. Windblown sands and silts form thick, rich soils and caliche locally. Havard shin oak—mesquite brush dominates the silty soils, whereas sandsage—Havard shin oak brush occupies the sand sheets. Numerous playa lakes scatter randomly over the treeless plains. The eastern boundary is a westward-retreating escarpment capped by a hard caliche. Headwaters of major rivers deeply notch the caprock, as exemplified by Palo Duro Canyon and Caprock Canyons State Parks.

On the High Plains, widespread small. intermittent streams dominate the drainage. The Canadian River cuts across the province, creating the Canadian Breaks and separating the Central High Plains from the Southern High Plains. Pecos River drainage erodes the west-facing escarpment of the Southern High Plains, which terminates against the Edwards Plateau on the south.

Basin and Range. The Basin and Range province contains eight mountain peaks that are higher than 8,000 feet. At 8,749 feet, Guadalupe Peak is the highest point in Texas. Mountain ranges generally trend nearly north-south and rise abruptly from barren rocky plains.

Plateaus in which the rocks are nearly horizontal and less deformed commonly flank the mountains. Cores of strongly folded and faulted sedimentary and volcanic rocks or of granite rocks compose the interiors of mountain ranges. Volcanic rocks form many peaks. Large flows of volcanic ash and thick deposits of volcanic debris flank the slopes of most former volcanoes. Ancient volcanic activity of the Texas Basin and Range province was mostly explosive in nature, like Mount Saint Helens. Volcanoes that poured successive lava flows are uncommon. Eroded craters, where the cores of volcanoes collapsed and subsided, are abundant.

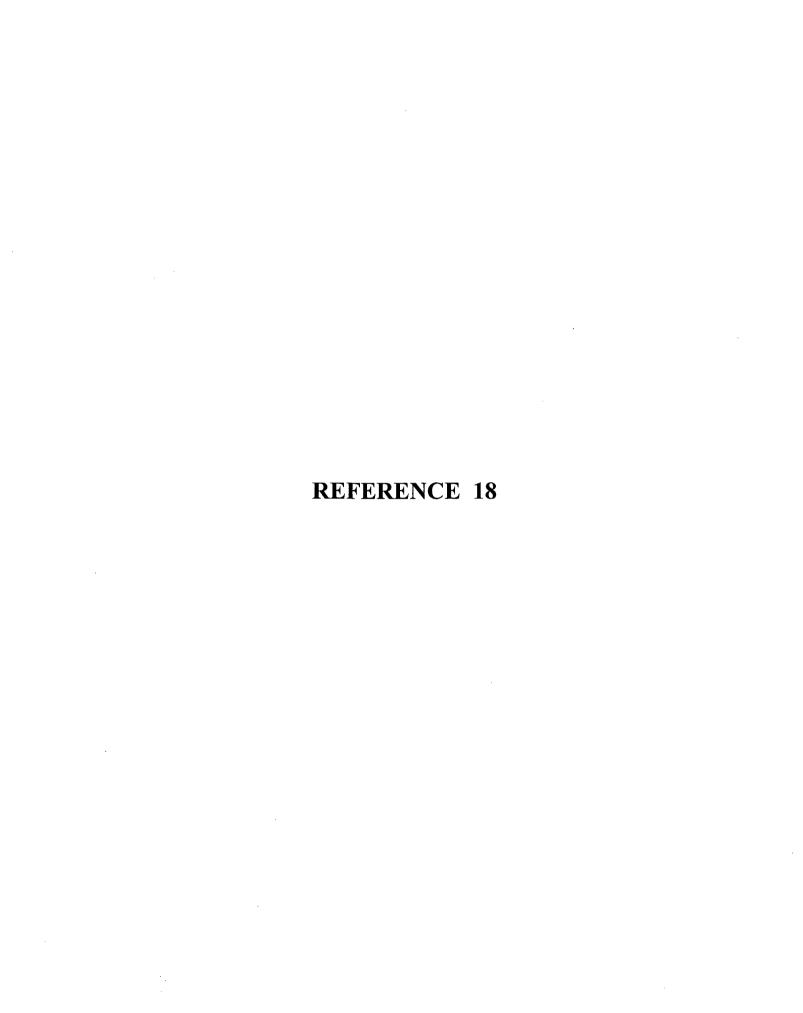

Gray oak-pinyon pine-alligator juniper parks drape the highest elevations. Creosote bush and lechuguilla shrubs sparsely populate plateaus and intermediate elevations. Tobosablack grama grassland occupies the low basins.

The Physiographic Map of Texas is a useful guide to appreciate statewide travel. Texas abounds with vistas of mountains, plateaus, plains, hills, and valleys in which many rock types and geologic structures are exposed. A variety of vegetation grows, depending on local climate.

Bureau of Economic Geology

The **Bureau of Economic Geology**, established in 1909, is a research entity of The University of Texas at Austin and also functions as the State Geological Survey. The Bureau conducts basic and applied research projects in energy and mineral resources, coastal and environmental studies, land resources, and geologic mapping. Reports and maps published by the Bureau are available for a nominal price. A list of publications is available on request.

TEXAS DEPARTMENT OF WATER RESOURCES

REPORT 269

OCCURRENCE, AVAILABILITY, AND CHEMICAL QUALITY OF GROUND WATER IN THE CRETACEOUS AQUIFERS OF NORTH-CENTRAL TEXAS VOLUME 1

Ву

Phillip L. Nordstrom, Geologist

April 1982

dissected into steep hills and deep ravines. The very sandy soil supports a heavy growth of post oak and blackjack oak.

The Grand Prairie is underlain by alternating limestones and marls of the Washita and Fredericksburg Groups. The intervening marls form low escarpments that connect successive uplands and produce a "cuesta" topography. The surfaces of the terraces slope gently eastward, broken only by the westward-facing escarpments. The thin mantle of light brown to black loamy soil is well drained and its characteristics differ depending on the nature of the underlying material. The broad, gently rolling, grass-covered plain is usually treeless except for isolated clumps of upland timber.

The Eastern Cross Timbers coincides with the narrow belt of the Woodbine Group outcrop and is characterized by low, rounded, wooded hills along the western margin and gentle slopes along the eastern margin. It is well d ssected by streams leaving some areas quite rugged in appearance. The soil is reddish sand with iron concretions and some clay. The surface supports a dense growth of timber, consisting chiefly of post oak and blackjack oak.

The remaining Cretaceous formations and the Midway Group form the base of the Black Prairie. It is characterized by a relatively flat to gently undulating surface that slopes gently to the east. The Black Prairie is poorly drained constituting the famous blackland soil and relatively treeless.

A small part of the study region falls within the East Texas Timber Belt which is underlain by the Wilcox and has a sandy, slightly hummocky surface.

Land-surface elevations range from 1,450 feet (442 m) in the west to 250 feet (76 m) above mean sea level in the northeast. The 20-county area lies within the Red, Sulphur, Sabine, Trinity, and Brazos River basins. Drainage is to the southeast.

Climate

The climate of the region covered by this report is characterized by long, hot summers and short, mild winters. The average minimum temperature for January, the coldest month, ranges from 32°F (0°C) in the northwest to 36°F (2°C) in the southeast. The average maximum temperature for July, the hottest month, is 96°F (36°C) throughout most of the study area. The annual mean free air temperature for the period 1931-70 averaged 65" F (18°C).

The average annual precipitation ranges from 30 inches (76 cm) in the northwest to 45 inches (114 cm) in the northeast. These figures are based on National Weather Service records for the 77-year period 1900-76, and are illustrated on Figure 2 along with average monthly precipitation for periods of record at selected stations.

The average annual gross lake surface evaporation for the period 1940-70 ranges from 78 inches (198 cm) in the north-central area to 61 inches (155 cm) in the southeast.

Population

According to the 1978-79 Texas Almanac, the estimated 1975 populatior for the study region is over 2.75 million people, which is an average of 180 people per square mile (69.5 per km²). This represented about 25 percent of the State's population. More than 85 percent of the people in this region lived in urban areas having 2,500 or more inhabitants. Some of the urban areas are Bonham, Clarksville, Cleburne, the Dallas-Fort Decatur, Worth metroplex, Denton, Gainesville. Granbury, Greenville, Lewisville, McKinney, Paris, Plano, Sherman, Waxahachie, and Weatherford, The remaining inhabitants lived in rural areas or smaller communities.

Economy

The general economy is varied. Principal manufacturing plants are in or near large cities; however, some plants in smaller cities process local products. Manufacturing, transportation, business, and insurance are of primary importance in the Dallas-Fort Worth area. About one-third of the counties in the study region produce petroleum products. Cooke and Montague Counties have produced about 475 million barrels of oil since the mid-1920's. Agricultural economy, which averages about 230 million dollars per year, consists of cattle and poultry raising and dairy products with grain, grain sorghums, peanuts, cotton, and soybeans the principal Industrial activities include the crops. operation of sand and gravel pits, the production of clay and manufacture of brick and tile products, the production of cement materials, and the manufacture of cement.

Previous Investigations

Portions of the study region have been previously discussed in numerous publications related to geology

water-bearing formations in north-central Texas are of Cretaceous age.

The Cretaceous System is composed of two series, Gulf and Comanche, and each is divided into groups. The Gulf Series is divided into the following five groups: Navarro, Taylor, Austin, Eagle Ford, and Woodbine. The Comanche Series is divided into the following three groups: Washita, Fredericksburg, and Trinity.

The Taylor and Eagle Ford Groups consist predominantly of shale, limestone, clay, and marl and yield only small amounts of water in localized areas. The Navarro and Austin Groups consist of chalk, limestone, marl, clay, and sand and, except for the Nacatoch and Blossom Sands, yield only small amounts of water locally. The Nacatoch Sand of the Navarro Group and the Blossom Sand of the Austin Group yield small to moderate supplies of water to limited areas. The Woodbine Group is the only important aquifer of the Gulf Series in the area covered by this report. It consists of sand, sandstone, and clay and is capable of yielding small to large amounts of water. The Woodbine Group is discussed in detail in the sections covering the stratigraphy of the water-bearing formations and the occurrence and the availability of ground water.

Both the Washita and Fredericksburg Groups of the Comanche Series consist predominantly of limestone, shale, clay, and marl and yield only small amounts of water to localized areas. The Trinity Group is the principal water-bearing group of rocks in the region and is divided into the Paluxy, Glen Rose, Twin Mountains, and Antlers Formations. The Paluxy consists of sand and shale and is capable of yielding small to moderate amounts of water. The Glen Rose is predominantly a limestone and yields small quantities of water only to localized areas. The Twin Mountains is composed of conglomerate, sand, and shale. It is the principal water-bearing formation of Cretaceous age in the region and yields moderate to large amounts of water. The name Antlers Formation is applied north of the Glen Rose pinch-out, where the Paluxy and Twin Mountains coalesce to form one unit. Water-bearing members of the Trinity Group are discussed in detail in the sections covering stratigraphy of the water-bearing formations and occurrence and availability of ground water.

The relationship, approximate maximum thickness, brief description of lithology, and summary of water-bearing properties of the stratigraphic units are shown in Table 1. Outcrop areas of the various formations are illustrated on the geologic outcrop map (Figure 16). The altitude of the top of the formations

and their net sand thicknesses are shown on Figures 18 through 22, 27, and 29.

Geologic cross-sections are profiles portraying an interpretation of a vertical section of the earth. Five geologic cross-sections were constructed; two are strike sections and three are dip sections. Dip sections are constructed approximately perpendicular to the strike of the beds and parallel to the dip of the beds, while strike sections are constructed parallel to the strike of the beds. These five geologic: sections, illustrated on Figures 35 through 39, show the structure and stratigraphic relationships of the geologic units.

Structure

Pennsylvanian and Permian rocks in the outcrop along the west edge of the study area dip westward and northwestward at about 40 feet per mile (7.6 m/km). Permian beds probably extend not much farther eastward than Montague County. The Pennsylvanian sediments, which underlie the Cretaceous rocks in most of the remaining area, thicken from the outcrop eastward into the Fort Worth basin. The axis of this basin and many of the other major structural features in or near the report area are shown on Figure 4.

The Cretaceous System forms a southeastward-thickening wedge extending across the area into a structural feature known as the East Texas basin. Thickness of these rocks ranges from zero in the west to nearly 7,500 feet (2,286 m) in the southeast. Regional dip is east and southeast at rates of about 15 to 40 feet per mile (2.8 to 7.6 m/km). The dip rate increases to as much as 300 feet per mile (57 m/km) on the southeastward-plunging ridge called the Preston anticline. This anticline and an associated trough to the south (Sherman syncline) have caused a change in the regional outcrop pattern as shown on the geologic map (Figure 16).

Tertiary System beds dip regionally southeastward from the Mexia-Talco fault system, which extends in a northerly direction along the eastern margin of the report area, at a rate of about 100 feet per mile (19 m/km). Deviations from this dip rate occur locally due to the faulting. These beds attain a thickness of approximately 250 feet (76 m) within the area of study. However, just outside the area of investigation in southern Navarro County they reach a maximum thickness in excess of 1,000 feet (305 m).

Quarternary deposits occur along the floodplains of the Brazos, Red, Sulphur, and Trinity Rivers and

silty clays, and siliceous conglomerates of chert, quartzite, and quartz pebbles.

The Twin Mountains consists of a basal conglomerate of chert and quartz, grading upward into coarse- to fine-grained sand interspersed with varicolored shale. The sand strata are more thickly bedded in the lower part of the formation than in the upper and middle and can be correlated to the Hosston Formation to the south. It is in this lower massive sand that the majority of wells are completed. Varicolored shale and clay, predominantly red, occur throughout the formation. The shale grades vertically and laterally into sandy shale and sand, making correlations over long distances almost impossible. The upper part of the Twin Mountains also contains a considerable percentage of sand and sandstone strata but less than the lower part due to the increased interbedding of shale and clay. Few wells are developed in the upper part of the formation.

Beds dip toward the east from 30 feet per mile (5.7 m/km) near the outcrop to 95 feet per mile (18 m/km) near the downdip limit of fresh to slightly saline water as illustrated on the geologic cross sections and Figure 19 which shows the approximate altitude of the top of the Twin Mountains. Thickness varies considerably over the study region, generally increasing downdip and ranging from less than 200 feet (61 m) near the outcrop to 860 feet (262 m) in oil test HR-33-28-401. However, data on cross section C-C' (Figure 37) indicate that maximum thickness at the downdip limit of fresh to slightly saline water should reach approximately 1,000 feet (305 m).

The Twin Mountains Formation is the most important source of ground water for a large part of the study region and yields moderate to large quantities of fresh to slightly saline water to municipal and industrial wells. In 1974, over 41,000 acre-feet (50.6 hm³) of water was pumped from this aquifer for municipal and industrial uses.

Paluxy Formation

The Paluxy Formation is the upper member of the Trinity Group south of the Glen Rose pinch-out. It crops out in Hood, Parker, Tarrant, and Wise Counties and forms the surface of the Western Cross Timbers belt. The dip is easterly at an average rate of 30 feet per mile (5.7 m/km) near the outcrop, increasing to 80 feet per mile (15.2 m/km) near the downdip limit of fresh to slightly saline water as illustrated on the geologic sections and on Figure 18, which shows the approximate altitude of the top of the Paluxy and the extent of the outcrop in the study area.

The Paluxy is composed predominantly of fine- to coarse-grained, friable, homogeneous, white quartz sand interbedded with sandy, silty, calcareous, or waxy clay and shale. In general, coarse-grained sand is in the lower part. The Paluxy grades upward into fine-grained sand with variable amounts of shale and clay. The sands are usually well sorted, poorly cemented, and crossbedded. Pyrite and iron nodules are often associated with the sands and frequently contribute a red stain to the individual beds. In some areas along the outcrop, high iron concentrations are present in ground-water analyses.

Thickness of the Paluxy varies considerably throughout the study region. From a maximum thickness nearing 400 feet (122 m) in the northern part of the study area, the Paluxy thins to the south and southeast to less than 100 feet (30 m) with a net sand thickness of less than 40 feet (12 m). This thickness change is shown on the geologic sections and on Figure 20, which shows the approximate net thickness of sand and the downdip limit of fresh to slightly saline water.

The Paluxy Formation is an important aquifer in the study region and during 1974, produced over 10,000 acre-feet (12.3 hm³) of water for municipal and industrial use and provided water to many domestic and livestock wells. Water wells tapping the Paluxy aquifer yield small to moderate quantities of fresh to slightly saline water.

Woodbine Group

The Woodbine Group is the basal rock unit of the Gulf Series of Cretaceous age in the study area. It crops out in Cooke, Dallas, Denton, Grayson, Johnson, and Tarrant Counties with a northeast-southwest strike. In the northern part of Texas, the outcrop parallels the Red River in a west-east strike, cropping out in Fannin, Lamar, and Red River Counties (Figure 16). The regional dip is to the southeast at an average rate of 35 feet per mile (6.63 m/km) near the outcrop and up to 75 feet per mile (14.2 m/km) near the downdip limit of fresh to slightly saline water as illustrated on the geologic sections and on Figure 21, which shows the approximate altitude of the top of the Woodbine.

In the southern part of the study area, the Woodbine is composed of friable, ferruginous, fine-grained sand and sandstone with interbedded shale, sandy shale, and laminated clay. The upper part of the Woodbine displays a marked increase in shale and clay, while the lower portion exhibits a more sandy make-up. Ripple marks and large-scale crossbedding are prevalent throughout the entire Woodbine Group.

in Hood, Parker, and Wise Counties. Forty-seven irrigation wells that were inventoried accounted for 16 percent of the 1977 pumpage from the Twin Mountains.

The Twin Mountains Formation is the most prolific of the Cretaceous aquifers in the study area with about 55 percent of the total quantity of ground water utilized for municipal and industrial purposes. The quality of water is generally not as good as from the Paluxy or Antlers. However, higher well-yields allow some sacrifice in chemical quality. Approximately 700 analyses of water samples from the Twin Mountains have been tabulated and included in Table 10 which shows the range of constituents and properties of the water from representative wells. About 22 percent of these analyses contained dissolved-solids concentrations in excess of 1,000 mg/l.

Similar to the other Cretaceous aquifers in this study, the ground water from wells drilled on the outcrop of the Twin Mountains is hard and contains high concentrations of dissolved iron. In the downdip area, about 9 percent of the samples contain dissolved iron concentrations in excess of the recommended limit of 0.3 mg/, and about 83 percent of the water is soft. The maximum allowable level for fluoride in the study area is 1.6 mg/l according to Drinking Water Standards adopted by the Texas Department of Health. Over 230 analyses contained fluoride levels exceeding 1.6 mg/l. Most of the other constituent levels were close to the maximum. Therefore, the main problems related to water quality for this aquifer are excessive fluoride and dissolved-solids concentrations. The downdip limit of fresh to slightly saline water is encountered about 60 to 75 miles (97 to 121 km) east-southeast of the outcrop in the majority of the study area (Figure 25). This distance is considerably less in the northern part of the study area where the outcrop trends eastward in the vicinity of Red River.

Since there are no concentrated areas of ground-water irrigation on the Twin Mountains outcrop, not enough chemical-quality data could be obtained to present a detailed classification of irrigation waters. Generally speaking, the Twin Mountains irrigation wells that are scattered through northeastern Hood County showed a very high sodium hazard, medium to high salinity hazard, and RSC levels classified as unsuitable for irrigation. Limited use of these wells accompanied with crop rotation and good management is necessary for continued good land productivity.

Irrigation wells, located near Brock in Parker County and completed on the Twin Mountains outcrop, were sampled and the results showed a low sodium hazard, medium salinity hazard, and zero RSC. The

quality of water from 30 wells was suitable for irrigation use, but well yields limited extensive development.

Figure 29 shows the net sand thickness of fresh to slightly saline water-bearing sand in the Twin Mountains. Net sand thickness generally increases downdip in an easterly direction. Thickness increases from less than 100 feet (30 m) near the outcrop to over 400 feet (122 m) near the downdip limit of fresh to slightly saline water.

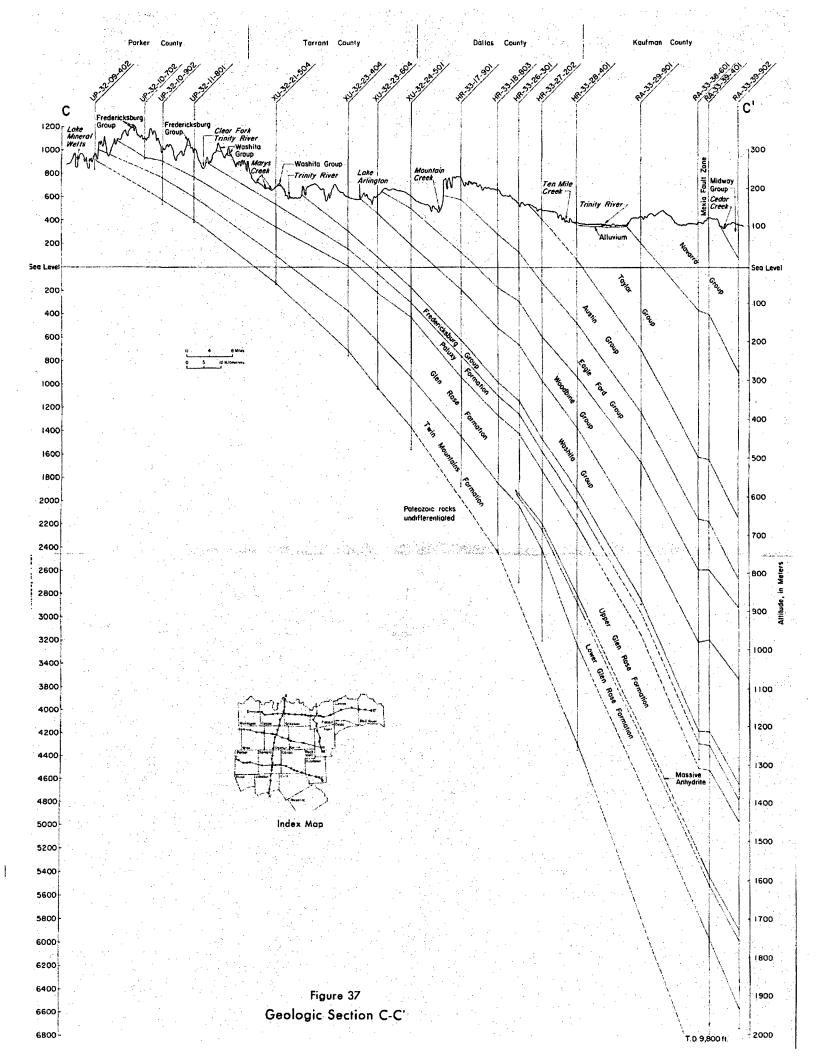

Areas for future development would have to be outside the Dallas-Fort Worth metroplex cone of depression. Even outside this influence, water levels are dropping over 10 feet (3 m) per year. There are several areas where waier quality restricts development of wells for irrigation use as previously noted and depicted on Figure 23. Wells tapping the Twin Mountains aquifer in areas downdip from the outcrop and in areas where quality is not a problem can expect a steady decline in water levels and yields.

Paluxy Formation

The Paluxy yields small to moderate amounts of fresh to slightly saline water to public supply, industrial, domestic and livestock wells in 16 of the 20 counties included in this study. The majority of the Paluxy outcrop occurs in Hood, Parker, Tarrant, and Wise Counties as illustrated on the geologic map (Figure 16) and occupies about 650 square miles (1,684 km²).

The primary source of recharge to the Paluxy is precipitation on the outcrop. Secondary sources include recharge from streams flowing across the outcrop and surface-water seepage from lakes. The Brazos and Trinity River systems and Eagle Mountain Reservoir are a few examples. The average annual precipitation on the outcrop is about 31 inches (79 cm). Only a small fraction of the amount is available as effective recharge since there is much runoff and evapotranspiration.

Water in the outcrop area is under water-table conditions and water levels remain fairly constant with only normal seasonal fluctuations. In downdip areas, water is under artesian conditions, and is confined under hydrostatic pressure from overlying formations. The average rate of movement of water in the Paluxy amounts to less than 2 feet (0.6 m) per year in an easterly direction except in downdip areas of heavy pumpage where cones of depression have occurred and movement is towards the center of the pumped wells. Water-level measurements indicate that the present hydraulic gradient is approximately 27 feet per mile

2.2 Geology

The Cretaceous sediments that comprise the Northern Trinity/Woodbine aquifer system extend from a small section of western Arkansas and southern Oklahoma through much of the northeastern quarter of Texas. Deposited upon a relatively flat erosional surface (paleoplain) carved into truncated, metamorphosed Paleozoic strata during the Triassic and Jurassic, these sediments form a southeastward-thickening wedge from Central Texas outcrop areas to the East Texas Basin (Nordstrom, 1982). The Trinity/Woodbine sediments were deposited throughout the Comanchean Series and the early Gulfian Series, and are subdivided (from oldest to youngest) into the Trinity, Fredericksburg, Washita, and Woodbine Groups (Hill, 1901). Trinity/Woodbine sediments were laid down in a variety of terrestrial and marine depositional environments. Because of the large degree of variability in thickness and lithology exhibited by these formations over the model extent, the geologic nomenclature describing the Trinity/Woodbine is complex, often varying with author, date, and region. In order to standardize the process of data collection and model construction, the following nomenclature was adopted for this GAM project. The Lower Trinity is defined as all formations below the Glen Rose including (from lower to upper) the Hosston/Sligo, Pearsall/Cow Creek/Hammett, and Hensell members of the Travis Peak Formation, while the Upper Trinity is defined as the Glen Rose and Paluxy Formations where defined (see Figures 2.12 and 2.13). Figures 2.14 through 2.18 illustrate the regional stratigraphic relationships of the Trinity/Woodbine units.

Extending from McLennan County at its southern edge to the Red River in the north, the Woodbine Formation was deposited in the late Cretaceous (Gulfian Series). The Woodbine is composed of sand, silt, clay, and some gravel, and ranges in thickness from less than 100 feet in the south to over 600 feet in northern downdip areas. South of McLennan County in Central Texas, where the thick sands of the Woodbine are no longer present, the Pepper Shale is equivalent to the Upper Woodbine (Adkins and Lozo, 1951). The Woodbine is divided into two members from oldest to youngest: the Dexter Member and the Lewisville Member. These members are composed chiefly of sediments deposited in fluvial, high-destructive deltaic, and shelf-strandplain depositional systems. The Ouachita Mountains in Southern Oklahoma and Arkansas served as the source of Woodbine sediments, which were subsequently deposited into the actively subsiding East Texas Basin (Oliver, 1971). The Woodbine is unconformably overlain by the Eagle Ford Group throughout most of the study area, which acts as a confining unit to the Woodbine (Yelderman, 2002). The Eagle Ford is comprised predominantly of shale with thin beds of limestone and bentonite, and increases in thickness from about 150 feet in the south to greater than 500 feet in northern Texas. As shown in Figure 2.19, the net sand content of the Woodbine is also greatest in downdip areas in

northern Texas. In this region, the sand thickness increases from less than 100 feet near the outcrop to over 400 feet near the Luling-Mexia-Talco Fault Zone (Section 4.2).

The Fredericksburg and Washita Groups separate the Paluxy from the overlying Woodbine Formation. The Fredericksburg Group is comprised of the Walnut Formation, Comanche Peak, and Edwards Formations in southern areas. In the northern portion of the model area, the carbonate facies of the Fredericksburg is generally classified as the Goodland Formation, which forms a very distinct contact on geophysical logs with the Kiamichi Clay, defined herein as the basal unit of the Washita Group. Deposited during late Comanchean times, the Washita Group is subdivided into various formations with very complex stratigraphic nomenclature, depending upon region and author. The Fredericksburg and Washita Groups consist primarily of limestone, dolomite, marl, and shale facies (Leggat, 1957), and have a combined thickness ranging from about 450 to 900 feet in the model area.

The Lower Cretaceous Paluxy Formation consists of sand, silt, and clay, deposited unconformably atop the underlying Trinity Group sediments. Separated from the Lower Trinity aquifers by the Glen Rose Formation throughout most of the southern section of the study area, the Paluxy merges with and generally becomes indistinguishable from the Hensell and Hosston in the north and northwest. The boundary with the overlying clay-rich Walnut Formation is characterized as a gradational, interfingering contact, which suggests time-equivalent deposition (Atlee, 1962). The Ouachita and Arbuckle Mountains in Oklahoma provided the source of Paluxy sediment, which was redeposited in fluvial, deltaic, and strandplain depositional environments in northeastern Texas (Caughey, 1977). The Paluxy increases in total thickness from a featheredge in the southern portion of the study area to greater than 600 feet in the north and northwest. Similarly, the net sand thickness (as derived in this study from geophysical logs) grows from just a few feet in the south to more than 250 feet in northern Texas (Figure 2.20). The sands and silts that comprise the Paluxy are composed primarily of fine-grained, friable, quartz grains, which are, in general, well sorted, poorly cemented, and crossbedded (Klemt et al., 1975).

The Glen Rose Formation lies below the Paluxy Formation throughout most of the model area. Conformable and gradational with the underlying Travis Peak Formation, the Glen Rose strata were deposited on a laterally extensive shelf area known as the Central Texas Platform. The Glen Rose is composed primarily of dense, finely crystalline limestone with varying amounts of shale, sandy-shale, and anhydrite distributed throughout the unit. The type, volume, and distribution of sediments were controlled primarily by eustatic cycles, which resulted in the alternation between classic tidal flat depositional environments during regressive stages, and deeper marine (neritic) environments during transgressive periods (Davis, 1974). The Glen Rose carbonates are present throughout most

of the study area, but pinch out in the west and northwestern portions of the model domain. In regions where the unit is defined, the thickness is variable, but averages about 500 feet throughout the study area.

The Cretaceous strata underlying the Glen Rose Formation have traditionally been designated as the Twin Mountains Formation in northern Texas and the Travis Peak Formation in Central Texas. The Travis Peak is comprised of three members: the Hosston/Sligo Member, the Pearsall/Cow Creek/Hammett Member, and the Hensell Member. In general, the assignment of Twin Mountains has been applied in regions where the contacts between the individual members are ambiguous, while the assignment to the Travis Peak Formation is made when the boundaries between subdividing members are well defined, although this is not always the case. Additional nomenclatural ambiguity results in northern sections where the definition between the Hensell and Hosston is not clear and the carbonates of the Glen Rose Formation are not distinguishable. In these areas, the sediments separating the sands of the Paluxy and the Lower Trinity are (by default) attributed in geologic nomenclature either to the Paluxy or to the Twin Mountains/Travis Peak. Where this occurs, the combined Paluxy-Twin Mountains/Travis Peak strata are referred to as the Antlers Sand.

The Hensell Member was defined by Hill (1901) and is designated as the uppermost, sandy, subdivision of the Travis Peak Formation. The lithologic makeup of the Hensell is similar to that of the Hosston, containing a large percentage of fine to coarse-grained sand interbedded with shales and, in the basal section, pebbly conglomerate lenses (Boone, 1968). Hensell sand deposits exhibit poor cementation and common cross-beds (Nordstrom, 1987). The Hensell does not generally exhibit the basinward thickening of sand deposits seen in other Trinity/Woodbine aquifer units. Instead, the sand thickness of the Hensell is relatively uniform, ranging between 50 to 100 feet throughout most of the region (Figure 2.21). Source rock for the Hensell was derived from regions located to the north and west of the study area, which were eroded and redeposited to the southeast within fluvial and deltaic depositional regimes (Hall, 1976).

The Pearsall/Cow Creek/Hammett Member separates the Hensell and Hosston/Sligo Members of the Travis Peak Formation. This composite member defines the carbonate and clay-rich clastic sediments deposited during early Comanchean times. Predominantly composed of limestone in downdip areas, the carbonate facies of the Cow Creek gradually thins and pinches out in the western (updip) portion of the study area. Where the Cow Creek limestones are not present, the shales of the Cow Creek and Hammett Members coalesce and become indistinguishable as separate units. Updip of this convergence zone, the argillaceous composite unit is defined as the Pearsall Member. The

Pearsall/Cow Creek/Hammett averages 100 to 200 feet thick, and is generally distinguishable on geophysical logs in the south, but is not clearly defined in northern portions of the study area.

The Hosston/Sligo Member of the Travis Peak Formation represents the first sequence of preserved Cretaceous deposits in the study area. Composed primarily of fossiliferous, dolomitic limestone with interbedded shale, the Sligo is the downdip, marine equivalent to the Hosston Sand (Klemt et al., 1975). Ranging in thickness from 0 to 130 feet, the Sligo is thickest in eastern, downdip areas, and grades into sandstone and shales that become indistinguishable from the Hosston west of the Waco area. In the outcrop, the Hosston Sand is interpreted to be equivalent to the Sycamore Sand (Stricklin et al., 1971) as defined by earlier researchers. This unit is composed of thin to massively bedded, fine to medium grained orthoclase-rich quartz sand interbedded with sandy clay (Boone, 1968). As illustrated in Figure 2.22, the net sand thickness of the Hosston averages about 175 feet in the model area, with a maximum of about 500 feet in downdip areas. Because the Hosston/Sligo was deposited upon valleys and ridges that existed in the pre-Cretaceous surfaces, the total thickness of deposition varies in the study region. In general, local Hosston/Sligo deposits are thicker in valley areas, while locally thinner deposits are found in areas where the underlying strata formed ridges. Within the model area as a whole, the total thickness of the Hosston sand averages about 240 feet, with deposits in downdip portions of the study area exceeding 1,500 feet in thickness.

Two major fault zones displace Trinity/Woodbine sediments: 1) the Luling-Mexia-Talco Fault Zone, and 2) the Balcones Fault Zone. These zones significantly affect the flow within the aquifer system, which in turn influences the quality and availability of Trinity/Woodbine groundwater. Sections 4.1 and 4.2 discuss the geologic history and occurrence of these features in the model area.

GEOLOGIC ATLAS OF TEXAS DALLAS SHEET

GAYLE SCOTT MEMORIAL EDITION

VIRGIL E. BARNES, Project Director

1972 Revised 1988

Alluvium and Quaternary deposits undivided

Alturium, Qal, flood-plain deposits including indistinct low terrace deposits; gravel, sand, silt, silty clay, and organic matter. Quaternary deposits undivided, Qu, mostly colluvium with some alluvium and alluvial fan deposits

Fluviatile terrace deposits

QUATERNARY

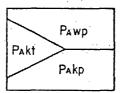

TERTIARY

Gravel, sand, silt, and clay; contiguous terraces of different ages separated by solid line

Wilcox Group undivided

Mostly mudstone with various amounts of sandstone, lignite, ironstone concretions, locally glauconitic in uppermost and lowermost parts. Mudstone, massive to thin bedded, interbedded with landinge of silt and very fine sand, pale brown to yellowish brown in upper part, medium to dark gray in lower part, weathers yellowish brown. Sandstone, medium to fine grained, moderately well sorted, cross-bedded, lenticular in upper part, units a few inches to 30 feet thick in lower part, light gray to pale yellowish brown and yellowish brown to moderate brown. Lignite mostly near middle of formation, seams 1-20 feet thick, brownish black. Abundant plant fossils, a few marine megafossils. Thickness 1,000-1,500 feet

Midway Group

Includes Wills Point Formation, Pawp, Tehnacana Member of Kincaid Formation, Pakt, and Pisgah and Littig Members of Kincaid Formation undivided, Pakp

Wills Point Formation, Pawp, clay, silty, sandy, silt and sand more abundant upward, slightly glauconitic near base, 10-inch rosette limestone bed below middle, massive, poorly bedded, grades upward to mudstone and sand of Wilcox Group, light gray to dark gray; weathers medium gray to yellowish gray, topographically featureless; thickness 550± feet

Tehuacana Member of Kincaid Formation, Pakt, limestone, silty, slightly glauconitiv, hard, white to light gray, interbedded with light gray mark, thickness up to 30 feet, outcrop discontinuous, absent south of Trinity River

Pisgah and Littig Members of Kincaid Formation undivided, PAkp, sand and clay. Sand, glauconitic, argillaceous, poorly sorted, medium gray to greenish gray, some hard sandstone beds near top; clay, sandy, silty, phosphatic pebbles and nodules present in lower part, medium gray to dark gray; weathers to yellow and yellowish brown soil. Thickness 150± feet

Kkc

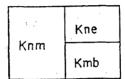

Kemp Clay and Corsicana Marl undivided

Mostly clay, calcareous, locally silty, compact, thinly laminated, subconchoidal fracture, medium dark gray; weathers light gray and fissile; some interbeds of fine-grained sandstone near base; marine megafossils; thickness 300-400 feet

Kns

Nacatoch Sand

Quartz sand, fine grained, poorty sorted, friable, silty, glauconitic, local lenses of silty clay, compact, light gray to greenish gray; thin calcareous sandstone beds in upper and lower parts; marine megafossils; thickness 250± feet

Neylandville Formation and Marlbrook Marl

Neylandville Formation and Marlbrook Marl undivided, Knm, south of Rockwall County; where subdivided includes from top down Neylandville Formation, Kne, and Marlbrook Marl, Kmb Neylandville Formation, Kne, clay, calcareous, silty, sandy, sand content increases upword, medium gray; weathers light gray, forms irregular topography; thickness 125± feet

CRETACEOUS

Marlbrook Mart ("upper Taylor mart"), Kmb, clay, calcarcous, variable amount of sitt and glauconite, sitt content increases upward, disseminated pyrite, locally phosphate nodules and phosphatized marine megafossils, blocky, conchoidal fracture, light to dark gray, weathers light gray with poor fissility; marine megafossils; thickness 350± feet

Kpg

Pecan Gap Chalk (?)

Marl and clay, very sandy and silty, medium gray; thickness up to 40 feet, feathers out southward northeast of Rockwall

Kwc

Wolfe City Formation

Mart, sand, sandstone, and mudstone. In Navarro County, mart, sandy and silty, interbedded with thin sandstone beds and massive sandstone; medium gray. Grades northward into an upper fine-grained sand and silt unit, calcareous, medium yellowish gray; and a lower undstone unit, calcareous, dark gray, weathers medium gray. Marine megafossils. Thickness 75-300 feet, thins northward.

Ozan Formation ("lower Taylor marl")

Clay, calcareous, silt and sand content increases upward, montmorillonitic, blocky, conchoidal fracture, medium gray; some glauconite, phosphate pellets, hematite nodules, and pyrite nodules; some very thin limestone lenses locally in lower part; weathers light brownish gray with poor fissility, grades upward to Wolfe City Formation; marine megafossils; thickness 500± feet

Kau

Austin Chalk

Upper and lower parts, chall, mostly microgranular calcite, massive, some interbeds and partings of calcareous clay, thin bentonitic beds locally in lower part, lower part forms westward-facing scarp; light gray. Middle part, mostly thin-bedded mart with interbeds of massive chalk, locally burrowed, marcasite-pyrite nodules common, light gray. Weathers white, marine megafossils scarce, thickness 300-500 feet, thins southward

Kef

Eagle Ford Group undivided

North of Hill County, shale, sandstone, and limestone; shale, bituminous, selenitic, with calcurcous concretions and large septaria; sandstone and sandy limestone in upper and middle parts, platy, burrowed, medium to dark gray; in lower part bentonitie; hard limestone bed marks base in Ellis and Johnson Counties; locally forms low caesta; thickness 200-300 feet

CRETACEOUS

Kwb

Woodbine Formation

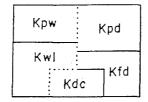

Sandstone, some clay and shale. Upper part, mostly sandtone, fine grained, well sorted, in part tuffaceous, ripple marked, large scale cross-hedding, reddish brown, near top some sandstone with large discoid concretions, medium to coarse grained, frioble, some shale, jurositic, gray, fissile, some marine megafossils, oyster reefs locally. Middle part, mostly sandstone, fine grained, cross-bedded, some interbeds of clay, carbonaceous, in part sandy, gray to brown. Lower part, interbedded sandstone and clay; sandstone, fine grained, very thinly bedded to massive, some beds of ironstone and ironstone conglomerate, white, red, brown; clay, sandy, gray to brown; channeled locally. Thickness 175-250 feet, thickess northward

Kgm

Grayson Marl and Main Street Limestone undivided

Mostly Grayson Mart, mostly calcarrous clay and mart, blocky, yellowish gray and medium gray; some 0.25-1.0-foot limestone beds in upper one-third, very fine grained, fossiliferous; weathers yellowish brown, forms gentle slope; thickness 60-100 feet, thins northward

Main Street Limestone, medium grained, chalky, some 6-8-foot units of calcareous shale, thin hedded to massive, distinctly bedded to wavy bedded and nodular, yellowish groy, weathers light gray to white; thickness 20-35 feet, thins northward

Pawpaw Formation, Weno Limestone, Denton Clay, Fort Worth Limestone, and Duck Creek Formation

Pawpaw Formation and upper limestone unit of Weno Limestone undivided, Kpw, south of Fort Worth area; Pawpaw Formation, Weno Limestone, and Denton Clay undivided, Kpd, in Fort Worth area and northward; middle shale and lower limestone units of Weno Limestone, Denton Clay, Fort Worth Limestone, and Duck Creek Formation undivided, Kw, south of Fort Worth area; Fort Worth Limestone and Duck Creek Formation undivided, Kfd, in Fort Worth area and northward; and Duck Creek Formation, Kdc, mapped separately in Parker County and western Turrant County

Pawpaw Formation, claystone, mudstone, and sandstone. Claystone and mudstone, massive, slightly scienitic. Sandstone, fine to very fine grained, platy, ripple cross-laminations, light clive gray to medium gray. Forms grass-covered slopes. Marine megafossils. Thickness 10-25 feet, thins

- southward

Weno Limestone, consists of upper limestone, middle alternating clay and limestone, and lower limestone units. Upper limestone, aphanitic, in part bioclastic, soft and chalky to hard and compact, massive, light gray and yellowish gray; weathers gray and yellowish brown, forms a topographic bench; marine megafossils; thickness 2-20 feet, thins northward. Middle unit:In Tarrant County—mostly calcareous clay, massive, some lenses of sand-size shell debris, olive brown to olive gray; marine megafossils are oysters and molds of small pelecypods. In southwestern Johnson County—alternatiny limestone and clay; limestone, uphunitic, bioclastic, in part burrowed, some sparry bioclastic limestone, beds pinch and swell, 0.1-1.0 foot thick, medium gray, weathers yellowish brown; clay, calcareous, medium to dark gray, weathers yellowish gray and yellowish brown, fossils include pelecipods, ammonites, echinoids, vertebrate bones, and lignifized wood; thickness 15-45 feet, thins southward. Lower limestone, uphanitic, in part sandy, fossiliferous, burrowed to south, massive, progressively more resistant southward, forming scarp, light gray, medium gray where sandy, weathers yellowish brown, thickness 1-5 feet, thins northward. Thickness from about 60 feet in Tarrant County to about 25 feet in northern Hill County

Denton Clay, alternating clay, mart, and limestone, total limestone in unit remains about constant as amount of clay and mart varies. Clay, calcareous, considerable shell debris, locally burrowed, a few irregular calcareous concretions, units 1-3 feet thick, marine megafossils are Anomia, Gryphaea, and pelecypod molds. Mart, ranges from calcareous clay to aphanitic argillaceous limestone, soft, yellowish brown, weathers dusky brown. Limestone aphanitic, Gryphaea-bearing beds 0.1-0.6 foot thick, locally pinch and swell, dark gray, weathers dusky brown; marine megafossils are Gryphaea, Pecten, and Anomia. Thickness 6-25 feet, thins

CRETACEOUS

southward

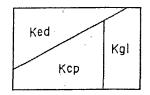

Fort Worth Limestone, limestone and clay. Limestone, aphanitic to biosparite, burrowed, beds 0.2-2 feet becoming thicker and more massive southward, light to medium gray; weathers yellowish brown; marine megafossils are Pecten, oysters, echinoids, and ammonites. Clay, calcareous, in units 0.1-5 feet thick, medium gray to yellowish brown; weathers yellowish brown, forms low rolling hills. Thickness 25-35 feet

Duck Creek Formation, Kdc, limestone, aphanitic, in part bioclastic, locally burrowed, purite nodules up to 0.2 foot, beds 0.2-2 feet thick, pinch and swell, medium gray to yellowish gray; weathers dark gray with yellowish-brown patches, locally forms topographic benches; marine megafossils are Gryphaea and ammonites; thickness 30-100 feet, thins southward

Kki

Kiamichi Formation

Clay and limestone in alternating units 0.1-5 feet thick; some sandstone. Clay, calcareous, olive brown, weathers yellowish brown, constitutes about two-thirds of formation. Limestone mostly aphanitic and bioclastic, locally burrowed, medium gray to yellowish gray; weathers yellowish brown. Sandstone, fine grained, moderately well sorted, calcareous, burrowed, beds 0.1-0.2 foot thick, medium gray; weathers yellowish brown. Marine megafossils are Gryphaea; some Pecten in sandstone. Thickness 20-50 feet, thins southward

Edwards Limestone, Comanche Peak Limestone, and Goodland Limestone

Edwards Limestone, Ked, in thicker sections consists of an upper scarp-forming radistid facies, a middle aphanitic to biosparite fessiliferous limestone, and a lower bioclast-packed aphanitic to sparry limestone with individual corals, light gray to yellowish gray; weathers various shades of gray with moderate brown patches; thickness up to 40 feet, gradually merges with Comanche Peak Limestone or Goodland Limestone in the vicinity of the northern Hood Caunty line

Comanche Peak Limestone, Kcp, limestone and some clay. Limestone mostly aphanitic, bioclustic to fossiliferous, soft, a few harder Gryphaea-bearing beds about 25 feet above base form benches, light to medium gray; weathers various shades of gray, locally mottled yellowish brown; marine megafossils are gastropods, ammonites, echinoids, Pecten, Lima, Gryphaea, and Exogyra texana. Clay, calcareous, intergradational with nodular limestone, beds 1-5 feet thick, medium to dark gray, weathers yellowish brown, fossiliferous. Thickness 90± feet

Goodland Limestone, Kgl, intergradational laterally with Comarche Peak Limestone and differs from it chiefly in that the Goodland is more coarsely nodular, contains fewer and thinner clay beds, and massive resistant limestone beds are more numerous; upper 5 feet, massive, bioclast-packed aphanitic limestone and limestone composed of oolites in sparry calcite; thickness 90± feet

. Kwa

Walnut Clay

CRETACEOUS

Clay and limestone about equally abundant. Limestone, aphanitic; in part bioclastic, Gryphaeabearing, beds 0.1-1 foot thick; in part nodular, grades laterally into either resistant, benchforming, Gryphaea-bearing limestone or calcureous clay; medium to dark gray, weathers yellowish brown. Clay, fossiliferous, calcureous, olive brown, weathers yellowish brown. Thickness 30± feet

Kpa

Paluxy Formation

Sandstone, mudstone, and limestone. Sandstone, fine to very fine grained, friable to calcite comented, cross-beds common, in part massive, locally burrowed, light gray to greenish gray; weathers yellowish brown to dusky brown. Mudstone, sandy, massive, locally burrowed, greenish gray, olive green, and medium gray; weathers yellowish brown and red brown. Limestone locally in upper 40-50 feet, sandy, fossiliferous, beds 0.5-2 feet thick, yellowish gray; weathers mottled dark gray and yellowish brown. Thickness 95-105 feet

Kgr

Glen Rose Formation

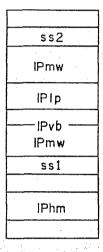

Limestone, alternating with units composed of variable amounts of clay, murl, and sand. Limestone, distinctly bedded, in part with variable amounts of clay, silt, and sand, soft to hard, various shades of brownish yellow and gray. Gradational to Paluxy Formation above and Twin Mountains Formation below, bench-forming beds included in the Glen Rose Formation, Thickness 40-200 feet, thins northward

CRETACEOUS

Ktm

Twin Mountains Formation

Upper part claystone, middle part sandstone above claystone, lower part mostly sandstone, some claystone and conglomerate. Sandstone, fine to medium grained in middle part, medium to course grained in lower part, sorting best in middle part, friable, locally large scale cross-. bedding, mostly light gray, some light brown near middle, Claystone, silty, mostly gray, locally in upper part green, yellow, red. Conglomerate, pebbles of chert and quartz, argillaceous, sandy, gray, brown. Thickness about 150 fect

Mineral Wells Formation

Mineral Wells Formation, IPmw, shale, sandstone, conglomerate, and limestone; sandstone, ss2, Lake Pinto Sandstone, IPIp, Village Bend Limestone, IPvb, sandstone, ss1, and Hog Mountain Sandstone, Phm. mapped separately. Shale, calcareous, locally contains sandstone and a few thin limestone beds, gray to black, a few plant fossits

Sandstone, ss2, fine to coarse grained, thin bedded to massive, brown, thickness 10 feet, feathers out southwestward on Abilene Sheet

Lake Pinto Sandstone, Plp, medium to fine grained, locally conglomeratic, thick bedded, brown, thickness 20-10 feet

Village Bend Limestone, Pvb, fine grained, locally sandy, thick bedded, yellow gray, weathers to small blocks, marine megafossils, forms laterally discontinuous lentils. Unickness up to 3 feet Sandstone, ss1, locally conglomeratic, thickness about 30-40 feet, feathers out southwestward near

Mineral Wells on Abilene Sheet Hog Mountain Sandstone, Phm, fine to medium grained, thick bedded to flaggy, brown, thickness about 25 feet. Thickness of exposed part of Mineral Wells Formation 400-500 feet, overlapping Cretaceous rocks cover upper third and other partions of formation including Turkey Creek Sandstone and Dog Bend Limestone, which are exposed on the Abilene Sheet immedi-

ately to the west

IPbr

Brazos River Formation

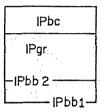

Sandstone, conglomerate, and mudstone; sandstone, coarse grained, ferruginous, cross-bedded, thick bedded to massive, reddish brown; mudstone, silty, gray, local lenses; conglomerate, angular pebbles of chert up to 1.5 inches in size, some clay ironstone, variegated, ferruginous cement common: thickness 100 feet

Des Moines Series Strawn Group IPm IPdv IPm

Mingus Formation

Mingus Formation, IPm, shale and sandstone; Dobbs Valley Sandstone, IPdv, mapped separately. Shale, sandy, poorly bedded, gray to buff

Dobbs Valley Sandstone. Pdv, medium grained, locally calcureous, commonly massive, reddish brown, some interbedded sandy shale, thickness about 45 feet. Thickness of exposed part of Mingus Formation about 300 feet; overlapping Cretaceous rocks cover lower part of formation including Santo Limestone; the Goen Limestone feathers out above the Dobbs Valley Sandstone a few miles to the west before reaching the Dallas Sheet

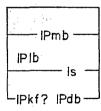

Grindstone Creek Formation

Grindstone Creek Formation, Pgr. shale, sandstone, and limestone; Buck Creek Sandstone, Pbc, and Brannon Bridge Limestones, Pbb2 and Pbb1, mapped separately. Shale, in part sandy, locally contains thin coal beds and sandstone lentils, gray

Buck Creek Sandstone, Pbc, coarse grained, massive, reddish brown, forms prominent scarp, thickness about 30 feet

Brannon Bridge Limestones, Pbb2 and Pbb1, fine grained, some interbedded shale, dark chert lenses in Pbb2, bedding uneven, indistinct to medium, gray, units up to about 15 feet thick, form distinct scarps and broad dip slopes; about 10 feet of shale separates the two limestone units. Thickness of exposed part of Grindstone Creek Formation about 225 feet; overlapping Cretaceous rocks cover upper part of formation; a third and higher Braunon Bridge Limestone feathers out a few miles to the west within the Abilene Sheet

Lazy Bend Formation

Lazy Bend Formation, Plb, shale, sandstone, and limestone; Meek Bend Limestone, Pmb, unnamed limestone, Is, Dennis Bridge Limestone, Pdbr, and Kickepoo Falls Limestone, Pkf, mapped separately. Shale, in part sandy, in part silty, local coal beds, and unmapped limestone lentils

Meek Bend Limestone, Pmb. fine grained, bedding thin flaggy to massive, gray, marine megafossils; thickness about 12 feet, exposed only in small creek west of Brazos River, well exposed on Abilenc Sheet to the west

Limestone, is, fine grained, locally grades into sandstone, medium to thin bedded, gray to brown, marine megafossils; thickness up to 6 feet, outcrop discontinuous and poorly exposed

Dennis Bridge Limestone, Pdb, fine grained, massive at base to thin bedded at top, gray to light brown, marine megafossils; thickness 10 feet, exposed at south end of Dennis Bridge over Brazos River and vicinity, approximately equivalent to Kickapoo Falls Limestone

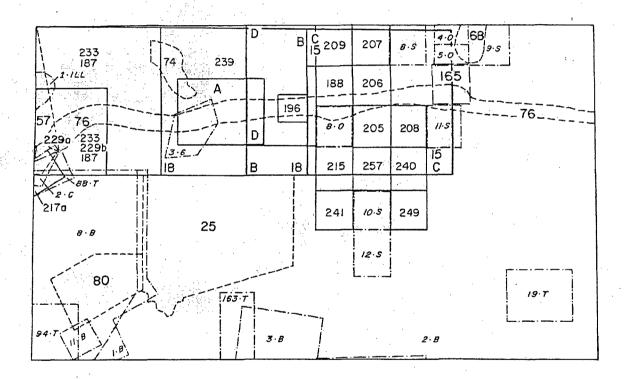

Kickapoo Falls Limestone, Pkt. fine grained, thick to medium bedded, upper part nodular, light gray, mottled dark gray, marine megafossils and algae; thickness up to 12 feet, approximately equivalent to Dennis Bridge Limestone, outcrop confined to Kickapoo Creek infar. Thickness of Lazy Bend Formation 275 feet

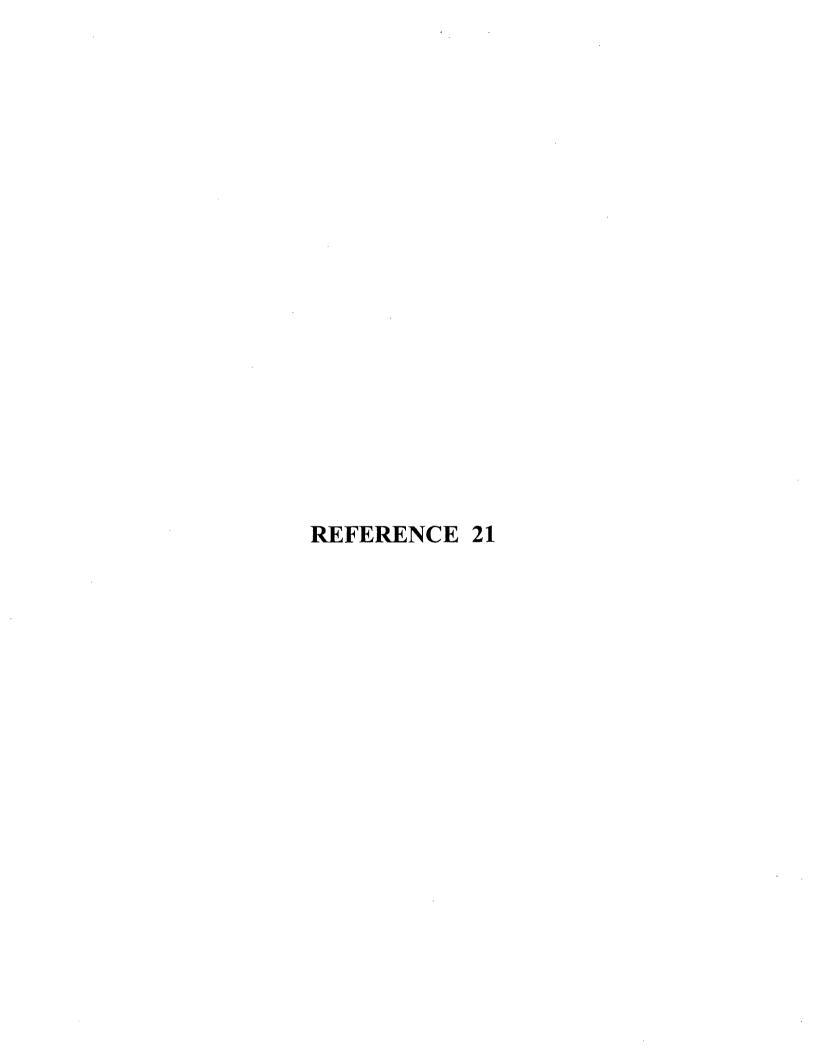

Geologic mapping by Shell Oil Company, Humble Oil and Refining Company, Dallas Geological Society Fort Worth Geological Society, Shell Development Company, J. H. McGowen, C. V. Proctor, Jr., W. T. Haenggi, D. F. Reaser, and sources shown on the Index of Geologic Mapping, Paleozoic mapping by L. F. Brown, Jr., and J. L. Goodson, J. H. McGowen, C. V. Proctor, Jr., W. T. Haenggi, and D. F. Reaser compiled the geologic mapping on high altitude aerial photographs, compiled unmapped areas photogeologically, and field checked all mapping. V. E. Barnes remapped, but did not field check, Quaternary deposits of Dallas and Tarrant Counties using U.S. Geological Survey 7.5-minute topographic quadrangles. Geologic mapping reviewed by Geologic Atlas Project Committees of the Dallas Geological Society, R. J. Cordell (Sun Oil Company), Chairman, E. G. Wermund (Mobil Research and Development Corporation), and R. L. Laury (Southern Methodist University); and the Fort Worth Geological Society, W. J. Nolte (Independent Geologist), Chairman, Leo Hendricks (Texas Christian University), and Edward Heuer. Geology scribed by J. W. Macon and Barbara Hartmann.

Extensive revision in the southeastern part of the Dallas Sheet relied on mapping furnished by Humble Oil and Refining Company. Where needed, V. E. Barnes remapped the Quaternary deposits of the sheet using U.S. Geological Survey 7.5-minute topographic quadrangles. The revision of the Dallas Sheet was scribed by John T. Ames.

INDEX OF GEOLOGIC MAPPING

Numbers in outlined areas refer to items in bibliography in "Index to Areal Geologic Maps in Texas, 1891-1961," by T. E. Brown (1963), Bureau of Economic Geology, University of Texas, Austin. For area A, see O. D. Weaver, J. A. Rogers, W. F. Buckthal, A. E. Kurie, E. R. Leggat, Dan McGill, and Ray Rall, Geologic map of central Tarrant County, Fort Worth Geological Society; for area B, see C. F. Dodge, Geologic map of the eastern half of Tarrant County, Texas (manuscript map, 1966); for area C, see G. H. June 2008

Summary of Regional Population Estimates

North Central Texas has added **131,000** persons during 2007 for a January 1, 2008 total population of **6,538,850**. This marks the twelfth consecutive year to add over 100,000 persons. A decrease in growth during 2007 can be explained by a slow down in new single-family completions.

Over 40 percent of the region's growth in 2007 was located in five cities. Dallas (1,300,350) led the region by adding 19,850 new residents. Fort Worth followed, adding 16,000 new residents, bringing the city's total population to 702,850 persons. McKinney (118,200) added 6,200 persons. Frisco pushed its total population to 97,600 by adding 5,500 residents. Plano (260,900) rounded out the top five in absolute growth by adding 5,200 persons.

Some smaller suburbs continued to see small to moderate changes in last year's population, especially in Collin, Denton and Rockwall counties. Lavon (1,950) led all cities with a 26% increase in population adding 400 residents. Fate (4,800), added 400 people, growing by 14%. Princeton (5,750) grew by 13%, adding 650 residents. Fairview (8,600) added 950 persons last year, a 12% change.

Finally, the cities of Melissa (3,900), Anna (7,800), Shady Shores (2,400), Sunnyvale (4,300), Royse City (10,100), and Forney (12,400) each experienced a greater than 8% increase in their population growth.

Collin, Dallas, Denton, and Tarrant counties captured 81% of all the regional growth, adding 106,500 persons. Tarrant County led all counties by adding 35,100 persons, pushing the county's total population to 1,780,150 residents. Dallas County closely followed by adding 34,150 persons for a 2008 population of 2,451,800. Collin and Denton counties each added over 10,000 persons last year and now total 748,050 and 614,650 persons, respectively. Outside of the four urban counties, the unincorporated areas of Ellis, Johnson, Kaufman, Parker, and Wise counties have shown significant growth

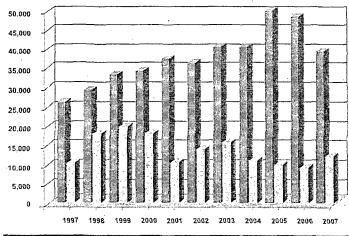

North Central Texas Council of Governments Research and Information Services

by adding nearly 9,000 persons in the past year.

In 2007, single-family home construction slowed significantly across the region. Nearly 39,000 new single-family units were completed, which is 9,000 fewer than in 2006. On the other hand, the region saw a sizeable increase in new multi-family units in 2007. Close to 11,600 multi-family units were added, up from 8,300 in 2006.

Compared to previous years there was a high number of vacant single-family units at the end of 2007, which was reflected in a lower single-family occupancy rate for some cities. On the other hand, multi-family occupancy rates increased region-wide. As long as the region continues to experience job growth, the vacant single-family units are likely to become occupied, and new single-family construction may once again pick up, however at a slightly lower pace than in previous years. Multi-family construction should continue at a pace comparable to the current rate.

For technical questions, contact *Duane Dankesreiter at ddankesreiter@nctcog.org*, Research and Information Services, NCTCOG. To order copies of this and other COG publications, contact *Alice Webster at awebster@nctcog.org*, Regional Information Center, NCTCOG, P. O. Box 5888 Arlington, TX 76005, (817) 695-9140.

Top Ten Cities account for 56% of all Growth (73,200 persons)

Population Estimates Methodology:

NCTCOG's population estimates are based on current housing inventories for each city in the NCTCOG region with a population of 1,000 or more. The figures are reviewed at the regional level for consistency with other indicators of regional population such as labor force estimates and vital statistics.

Cities complete a building permit form that provides NCTCOG with information on building completions, demolitions, annexations and other changes in housing stock that occurred throughout the prior year. The reported housing units by type (single family, multi-family, other) are added to the 2000 Census housing stock figures to develop estimates of current year housing stock. Current estimates use 2000 Census persons per household figures. Occupancy rates are derived through purchased secondary data in order to reflect existing market conditions.

These rates were used in conjunction with building permit data to produce city level population estimates. Final population for January 1, 2008 also includes estimates of persons living in group quarters (nursing homes, dormitories, prisons etc.) All figures are reviewed by each city prior to publication. County level estimates are adjusted for cities that are in more than one county.

Remainder of county totals are estimated based upon secondary resources and have been adjusted to reflect annexations.

The percent growth column provides a convenient indicator of the annual growth for each city and county.

DIFFERING CENSUS BUREAU ESTIMATES

There is normally a variance between Census Bureau and NCTCOG estimates as a result of several factors. They include:

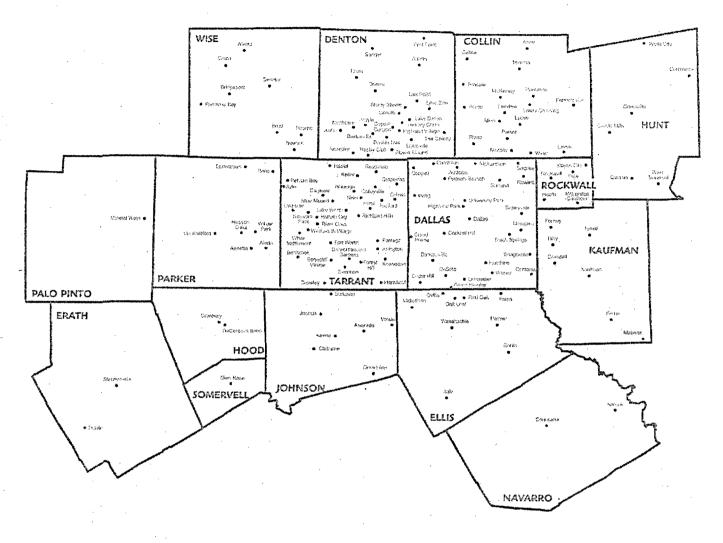

- The Census Bureau estimates are for the year ending July.
 2007 while the NCTCOG estimates are for the year ending December, 2007;
- The Census Bureau methodology is based on births, deaths, net domestic migration, and net international migration; and
- The NCTCOG methodology is based on building permits, occupancy factors and household size factors.

CHANGES TO ESTIMATION METHODOLOGY

Due to refinements in the NCTCOG's 2008 Population Estimates methodology, care should be taken in comparing with previous years published estimates:
